

### NXP Kinetis: Twr-K60D100M Cortex<sup>™</sup>-M4 Lab

ARM<sup>®</sup> Keil<sup>®</sup> MDK Toolkit *featuring Serial Wire Viewer and ETM Trace* Summer 2016 Version 1.99 by Robert Boys, <u>bob.boys@arm.com</u>

Introduction:

The latest version of this document is here: <u>www.keil.com/appnotes/docs/apnt\_284.asp</u>

The purpose of this lab is to introduce you to the NXP Cortex<sup>TM</sup>-M4 processor by using the ARM Keil MDK toolkit featuring  $\mu$ Vision<sup>®</sup> IDE. We will use the Serial Wire Viewer (SWV) and ETM<sup>TM</sup> trace on the Kinetis processor. For labs and appnotes for other Tower or Freedom boards see <u>www.keil.com/NXP</u>. MDK includes many example projects.

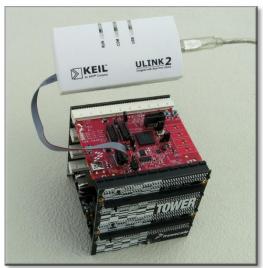

Keil MDK-Lite<sup>11</sup> is a free evaluation version that limits code size to 32 Kbytes. The addition of a license number will turn it into a full commercial version. Contact Keil sales for pricing, options and current special offers. Contact info is on last page.

**Linux and Android:** For Linux, Android, bare metal (no OS) and other OS support on NXP i.MX and Vybrid series processors see DS-5<sup>™</sup> at www.arm.com/ds5/ and www.keil.com/ds-mdk.

### Why Use Keil MDK ?

MDK provides these features particularly suited for Kinetis Cortex-M users:

- 1. μVision IDE with Integrated Debugger, Flash programmer and the ARM<sup>®</sup> Compiler toolchain. MDK is turn-key "out-of-the-box".
- 2. Compiler Safety Certification Kit: <u>www.keil.com/safety/</u>
- 3. TÜV certified. SIL3 (IEC 61508) and ASILD (ISO 26262).
- 4. ARM Compiler 5 and 6 (LLVM) included. You can also use GCC.
- 5. MISRA C/C++ support using PC-Lint. <u>www.gimpel.com</u>
- 6. Keil RTX is included. This full feature RTOS has a BSD license and sources are provided. This makes it free. <u>www.keil.com/RTX</u>.
- MQX: An MQX port for MDK is available including Kernel Awareness windows. See <u>www.keil.com/NXP</u>.
- 8. CoreSight<sup>™</sup> Serial Wire Viewer and ETM trace capability.
- 9. Choice of debug adapters: ULINK2<sup>™</sup>, ULINK-ME<sup>™</sup>, ULINK*pro*<sup>™</sup>, Segger J-Link and P&E OSJTAG.

- 10. Kinetis Expert compatible: A MDK 5 project is created that you can load directly into µVision. See kex.nxp.com/.
- 11. Keil Technical Support is included for one year and is renewable. This helps you get your project completed faster.
- 12. Affordable perpetual and term licensing. Contact Keil sales for pricing, options and current special offers.

### This document details these features and more:

- 1. Serial Wire Viewer (SWV) data trace including exceptions, display variables and ETM Instruction Trace.
- 2. Real-time Read and Write to memory locations for Watch, Memory, System Viewer and RTX Tasks windows. These are non-intrusive to your program. No CPU cycles are stolen. No instrumentation code is needed.
- 3. Six Hardware Breakpoints (can be set/unset on-the-fly) and one Watchpoint (also called Access Breaks).
- 4. A DSP example using ARM CMIS-DSP libraries which are included with MDK. All DSP source code is included.
- 5. Create a µVision project from scratch. Optionally add RTX. An example using Kinetis Expert is also provided.

Serial Wire Viewer (SWV): With a Keil ULINK2, ULINKpro or J-Link (Not with OpenSDA):

Serial Wire Viewer (SWV) displays Exceptions (including interrupts), data reads and writes, ITM (printf), CPU counters, PC Samples and a timestamp. RTX Event Viewer uses SWV. This information comes from the ARM CoreSight<sup>™</sup> debug module integrated into the Cortex-M4. SWV is output on the 1 bit Serial Wire Output (SWO) or the 4 bit Trace Port.

SWV does not steal any CPU cycles and is completely non-intrusive (except for the ITM Debug printf Viewer).

### **Embedded Trace Macrocell<sup>™</sup> (ETM):** ETM is available only with a Keil ULINK*pro*:

ETM records all executed instructions in addition to the features provided by SWV. ETM provides advanced features including Program Flow instruction debugging in assembly and C, Code Coverage, Performance Analysis and Execution Profiling. ETM trace requires a ULINK*pro* to capture and display the ETM trace frames.

### 1) General Information and introduction to MDK:

#### Keil Software: MDK 5 This document used MDK 5.20 and Pack 1.4.0. You can use a later version.

MDK 5 uses Software Packs to distribute processor specific software, examples, documentation and middleware. MDK 5 Core is first installed and you then download the Software Packs you require for your processor(s) from the web. A Pack can also be imported manually. You no longer need to wait for the next version of MDK or install patches to get the latest files. Software Packs are an ARM CMSIS standard. See www.keil.com/cmsis and https://github.com/ARM-software/CMSIS 5

**Kinetis Expert** provides software projects in MDK 5 format consistent with Software Packs.

#### Summary of the Keil software installation: This is a three step process:

- A. Download and install MDK Core. This is done in Step 2 below.
- B. Download and install the appropriate Software Pack for the processor you are using. This is done on the next page.
- C. In addition, you need to download and install the examples used in this tutorial. See page 5.

### Keil MDK Core Software Download and Installation:

- 1. Download MDK Core from the Keil website. www.keil.com/mdk5/install
- 2. Install MDK into the default folder. You can install into any folder, but this lab uses the default C:\Keil v5
- 3. We recommend you use the default folders for this tutorial. We will use C:\00MDK\ for the examples. The name Freescale is still used in MDK software but this will be soon changed to NXP.
- 4. If you install MDK or the examples into different folders, you will have to adjust for the folder location differences.

#### Licensing:

- 1. You can use the evaluation version (MDK-Lite) for this lab. No license is needed.
- You can obtain a one-time free 7 day license in File/License Management. If you are eligible, this button is visible: 2.
- 3. This gives you access to the Keil Middleware as well as unlimited code size compilation. Contact Keil Sales to extend this license for evaluation purposes.

#### **Debug Adapters:**

- 1. You do not need any debug adapters: just the TWR board, a USB cable, MDK 5 and a Pack installed on your PC.
- 2. If you want to use Serial Wire Viewer (recommended) use any Keil ULINK or a Segger J-Link. You will also need a 10 to 20 pin CoreSight cable to connect to J16 OSJTAG. This cable is normally provided with a ULINK2.
- 3. For ETM examples, a ULINK*pro* and a Tower board or one with the 20 pin CoreSight connector is needed.

#### Keil manufactures several adapters. These are listed below with a brief description.

- 1. ULINK2 and ULINK-ME: ULINK2 is pictured on page 1. ULINK-ME is offered only as part of certain evaluation board packages. ULINK2 can be purchased separately. They are electrically the same and both support Serial Wire Viewer (SWV), run-time memory reads and writes for the Watch, Memory and SVD Peripheral windows, Watchpoints and hardware breakpoint set/unset on-the-fly.
- ULINKpro: This is pictured on page 9. ULINKpro supports all SWV features and adds ETM Trace support. ETM 2. records all executed instructions. ETM provides complete instruction flow debugging, Code Coverage, Execution Profiling and Performance Analysis features. ULINKpro also provides the fastest Flash programming times.

#### Keil supports more adapters:

- 1. **OpenSDA:** An extra processor on your board becomes a debug adapter compliant to CMSIS-DAP. The NXP Freedom boards incorporate CMSIS-DAP. µVision communicates via USB to the CMIS-DAP processor which controls the target processor. This is selected like any adapter in the Target Options menu under the Debug tab.
- 2. P&E OSJTAG: µVision running on your PC directly connects to the Kinetis Tower board via a USB connection without any debugging hardware. OSJTAG is good for general debugging but advanced debugging features such as SWV or ETM are not implemented. These limitations are listed on page 8 along with the configuration instructions.
- Segger J-Link and J-Trace: J-Link Version 6 (black) or later supports Serial Wire Viewer. J-Trace provides ETM 3. but has not been tested in this document. Data reads and writes are not currently supported with a J-Link.

#### Getting Started MDK 5: Obtain this free, useful book here: www.keil.com/gsg/.

**Download MDK-Core** 

Evaluate MDK Professional

### 2) Software Pack Install Process:

#### 1) Start µVision and open Pack Installer:

When the first MDK install is complete and if you are connected to the Internet,  $\mu$ Vision and Software Packs will automatically start. Otherwise, follow Steps 1 and 2 below. Initially, the Pack master list must be downloaded from the web.

- 1. Connect your computer to the Internet. This is normally needed to download the Software Packs.
- 2. Start μVision by clicking on its desktop icon.
- 3. Open the Pack Installer by clicking on its icon: A Pack Installer Welcome screen will open. Read and close it.
- 4. The window below opens up: Select the Boards tab. Type **twr** in the Search box to filter the listings:

**TIP:** The Devices and Boards tabs are used to filter the items displayed on the right side in the Packs and Examples tabs.

- 5. Select TWR-K60D100M as shown here: You can also select individual processors under the Devices tab.
- 6. Note: "ONLINE" is displayed at the bottom right. If "OFFLINE" is displayed, connect to the Internet.

🔗 Pack Installer - C:\Keil_v5\ARM	\PACK

**TIP:** If there are no entries shown because you were not connected to the Internet when Pack Installer opened, select Packs/Check for Updates or to refresh once you have connected to the Internet. This is not done automatically.

#### 2) Install the Kinetis K60 Device Family Pack (K60\_DFP):

- 1. Click on the Packs tab. Initially, the Software Pack ARM::CMSIS is installed by default.
- 2. Select Keil::Kinetis\_K60\_DFP as shown above and click on Install. The latest Pack will download and install to C:\Keil\_v5\ARM\Pack\Keil\Kinetis\_K60\_DFP\ by default. This download can take two to four minutes.
- 3. Its status will then be indicated by the "Up to date" icon: status Up to date

#### 3) Install The Kinetis K60 Software Development Kit (SDK\_DFP):

- 4. Select Install beside Keil::Kinetis\_SDK\_DFP to install the NXP SDK Pack.
- 5. Its status will then be indicated by the "Up to date" icon:
- 6. Do not close Pack Installer yet as it is needed to download the RTX\_Blinky example on the next page.

**TIP:** You can also install a Pack manually. A Pack has a file extension .pack. It is an ordinary zip file with the extension changed so it is recognized by  $\mu$ Vision. You can download the Pack from the web or transfer the file in any other way. Double click on this file and it will automatically be installed by  $\mu$ Vision.

TIP: You can create your own Pack to distribute a DFP, BSP, SDK or confidential material.

For CMSIS-Pack documentation: www.keil.com/pack/doc/CMSIS/Pack/html/

For complete CMSIS documentation: www.keil.com/CMSIS/

### Install RTX\_Blinky, RTX\_Blinky\_4LEDS and DSP Examples:

### 1) Install RTX\_Blinky using Pack Installer Utility:

- 1 Select the Examples tab:
- Select CMSIS-RTOS 2. Blinky as shown here:
- 3. Select Copy : 🚸 Copy
- 4. The Copy Example window below opens up: Select Use Pack Folder Structure: Unselect Launch µVision:
- Type in C:\00MDK as 5. shown below right:
- Pack Installer C:\Keil\_v5\ARM\PACK - 🗆 🗵 Packs Window Help e l Board: TWR-K60D100M (Rev. Copy Exam

C:\00MDK

Destination Folde

✓ Use Pack Folder Structure

6. Click OK to copy the example file into C:\00MDK\Boards\Freescale\TWR-K60D100M\. Launch µVision should be unchecked.

- 7. Pack Installer creates the appropriate subfolders in C:\00MDK\.
- 8. Close Pack Installer. Open it any time by clicking:
- 9. If a window opens stating the Software Packs folder has been modified, select Yes to "Reload Packs ?"

TIP: The default directory for copied examples the first time you install MDK is C:\Users\<user>\Documents. For simplicity, we will use the default directory of C:\00MDK\ in this tutorial. You can use any directory.

#### 2) Install the DSP and 4LEDS Examples from www.keil.com:

- 1. Obtain the example software zip file from www.keil.com/appnotes/docs/apnt 28
- This folder will have been created: C:\00MDK\Boards\Freescale\TWR-K60D100M\ 2.
- 3. Extract the example zip into this folder. These folders will be created in \TWR-K60D100M\:

#### Super TIP: µVision icon meanings are found here: www.keil.com/support/man/docs/uv4/uv4 ca

#### **RTX Blinky and RTX Blinky 4LEDS: What is the difference ?**

- The K60D100M Tower board has LED D11 (green) connected to GPIO port PTA10. 1.
- 2 This is shared with ETM trace Data D0. This results in a conflict between the LED driver and the 4 bit Trace Port from where ETM data is output from the processor into the ULINKpro.
- 3. RTX\_Blinky does not use D11 and as a result only three LEDs blink. ETM can be used.
- 4. RTX\_Blinky\_4LEDS blinks all four LEDs: one for each of four threads. ETM cannot be used. SWV is still accessible via SWO (UART ULINK2 J-Link) and SWO Manchester with ULINKpro.

#### What you have accomplished so far:

- 1. Keil MDK Core is installed on your computer.
- 2. The K60 Device Family Pack (DFP) K60 is installed to C:\Keil v5\ARM\Pack\Keil\Kinetis K60 DFP.
- The Kinetis SDK Device Family Pack (DFP) is installed to C:\Keil\_v5\ARM\Pack\Keil\Kinetis\_SDK\_DFP. 3.
- The Packs example RTX\_Blinky is copied to C:\00MDK\Boards\Freescale\TWR-K60D100M. 4.
- Two extra examples are copied from www.keil.com to C:\00MDK\Boards\Freescale\TWR-K60D100M\. 5.

*Next*? We will examine two µVision utilities for managing Software Packs and Pack Version selection.

### 4) Software Pack Version Selection and Manage Run-Time Environment:

### This section contains three parts on this and the next page:

### A) Select Software Pack Version: this section is provided for reference:

This  $\mu$ Vision utility provides the ability to choose various Software Pack versions installed in your computer. You can select the versions you want to use. You must have  $\mu$ Vision running and any project open for the following exercises:

- $1. Select Project/Open Project and navigate to C: \label{eq:project} OMDK \label{eq:project} Boards \label{eq:project} Freescale \label{eq:project} TWR-K60D100M \label{eq:project} RTX_Blinky.$
- 2. Open Blinky.uvprojx. Blinky will load into  $\mu$ Vision.
- 3. Open Select Software Packs by clicking on its icon:
- 4. This window opens up. Note Use latest versions ... is selected. The latest version of the Pack will be used.
- 5. Unselect this setting and the window changes as shown similar to the one below right:

Use latest versions of all instal	led Software P	acks		
Pack	Selection	n	Version	Description
Keil::Kinetis_DFP	latest	Ŧ	1.0.10	Freescale Kinetis Series Device Support, Drivers and Examples
Keil::Kinetis_K00_DFP	latest	~	1.0.0	Freescale Kinetis K00 Series Device Support
Keil::Kinetis_K20_DFP	latest	Ŧ	1.3.0	Freescale Kinetis K20 Series Device Support and Examples
Keil::Kinetis_K40_DFP	latest	Ŧ	1.0.0	Freescale Kinetis K40 Series Device Support
	latest	Ŧ	1.4.0	Freescale Kinetis K60 Series Device Support and Examples
Keil::Kinetis_K70_DFP	latest	Ŧ	1.0.1	Freescale Kinetis K70 Series Device Support and Examples
⊡…Keil::Kinetis_KEAxx_DFP	latest	Ŧ	1.2.0	Freescale Kinetis KEAxx Series Device Support and Examples
Keil::Kinetis_KExx_DFP	latest	-	1.2.0	Freescale Kinetis KExx Series Device Support
⊡…Keil::Kinetis_KLxx_DFP	latest	Ŧ	1.6.0	Freescale Kinetis KLxx Series Device Support and Examples
N I W II IN DED			1 - 0	

- 6. Expand the header Keil::Kinetis\_K60\_DFP.
- You will see only one version the one you installed. If you had installed others, you would see them listed like this:
- 8. Select the fixed pull-down menu and see the three options as shown below:
- 9. If you wanted to use V 1.3.0, you would select fixed and then select the check box opposite 1.3.0.

fixed 💌	
latest	
fixed	
excluded	

Use latest versions of all installed Software Packs								
Pack Selection V								
Keil::Kinetis_DFP	fixed	•	1.0.10					
Keil::Kinetis_K00_DFP	excluded	•						
Keil::Kinetis_K20_DFP	excluded	•						
Keil::Kinetis_K40_DFP	excluded	•						
- Keil::Kinetis_K60_DFP	fixed	•	1.4.0					
1.4.0								
1.3.0								
Keil::Kinetis K70 DFP	excluded	-						

- 10. Re-select Use latest versions... Do not make any changes.
- 11. Click OK or Cancel to close this window.

6

### **B)** Manage Run-Time Environment: this section is provided for reference:

- 1. Click on the Manage RTE icon: 👽 The next window opens: This includes Keil Middleware, selected open source software, RTX and CMSIS drivers for various peripherals. Not all Packs offer all options but more are being added.
- Expand various headers and note the selections you can make. A selection made here will automatically insert the 2. appropriate source files into your project.
- 3. Note CMSIS-Core (system.c), Keil RTX and Device::Startup (startup.s) files are selected. You can see these files in the project window.
- Do not make any changes. 4. Click Cancel to close this window.

Software Component	Sel.	Variant	Version	Description		
CMSIS			Cortex Microcontroller Software Interface Components

TIP: Different colors represent messages:

₽ Green: all required files are located.

₽ Yellow: some files need to be added. Click the Resolve button to add them automatically or add them manually.

• Red: some required files could not be found. Obtain these files or contact Keil technical support for assistance.

The Validation Output area at the bottom of this window gives some information about needed files and current status.

#### **C)** Updating Source Files: this section is provided for reference:

Some of the files provided by a Software pack are stored in your project in ... RTE

If you update a Software Pack, some of these files might need to be updated from the new Pack. These files will show new icons as shown below and described here: www.keil.com/support/man/docs/uv4/uv4\_ca\_updswcmpfiles.htm

#### **Updating Source Files:**

- 1. Right click on a file. A window similar to the one below right opens:
- Select the appropriate Update selection 2.
- This procedure is described here: www.keil.com/support/man/docs/uv4/uv4 ca filegrp att.htm 3.

Icons for Software Components (SWC). Refer to Update Software Component Files for SWC containing modifications. ٩ SWC is available for the selected microcontroller. ٢ SWC is not available for the selected microcontroller. The SWC is part of another project target using another microcontroller. SWC has been selected previously, but the Software Pack containing this SWC has been uninstalled. Contains files with fully backward compatible corrections. ٠ Contains files with fully backward compatible extensions or new features. ٠ Contains files with incompatible modifications requiring modifications in the application code. Build target File with fully backward compatible corrections. A file update is not required. 2 File with fully backward compatible extensions or new features. A file update is recommended. 12 File with incompatible modifications. A file update is required.

- Open Build Log
- Rebuild all target files

### 5) CoreSight Definitions: It is useful to have a basic understanding of these terms:

Cortex-M0 and Cortex-M0+ have only features 2) and 4) plus 11, 12 and 13 implemented. Cortex-M3, Cortex-M4 and Cortex-M7 can have all features listed implemented. MTB is normally found on Cortex-M0+. It is possible some processors have all features except ETM Instruction trace and the trace port. Consult your specific datasheet.

- 1. JTAG: Provides access to the CoreSight debugging module located on the Cortex processor. It uses 4 to 5 pins.
- 2. SWD: Serial Wire Debug is a two pin alternative to JTAG and has about the same capabilities except Boundary Scan is not possible. SWD is referenced as SW in the µVision Cortex-M Target Driver Setup. See page 4, 2<sup>nd</sup> picture. The SWJ box must be selected in ULINK2/ME or ULINK*pro*. Serial Wire Viewer (SWV) must use SWD because the JTAG signal TDIO shares the same pin as SWO. The SWV data normally comes out the SWO pin.
- 3. JTAG and SWD are functionally equivalent. The signals and protocols are not directly compatible.
- 4. DAP: Debug Access Port. This is a component of the ARM CoreSight debugging module that is accessed via the JTAG or SWD port. One of the features of the DAP are the memory read and write accesses which provide on-the-fly memory accesses without the need for processor core intervention. μVision uses the DAP to update memory, watch and RTOS kernel awareness windows in real-time while the processor is running. You can also modify variable values on the fly. No CPU cycles are used, the program can be running and no code stubs are needed. You do not need to configure or activate DAP. μVision configures DAP when you select a function that uses it. Do not confuse this with CMSIS\_DAP which is an ARM on-board debug adapter standard.
- 5. SWV: Serial Wire Viewer: A trace capability providing display of reads, writes, exceptions, PC Samples and printf.
- 6. SWO: Serial Wire Output: SWV frames usually come out this one pin output. It shares the JTAG signal TDIO.
- 7. Trace Port: A 4 bit port that ULINKpro uses to collect ETM frames and optionally SWV (rather than SWO pin).
- ITM: Instrumentation Trace Macrocell: As used by μVision, ITM is thirty-two 32 bit memory addresses (Port 0 through 31) that when written to, will be output on either the SWO or Trace Port. This is useful for printf type operations. μVision uses Port 0 for printf and Port 31 for the RTOS Event Viewer. The data can be saved to a file.
- 9. **ETM:** Embedded Trace Macrocell: Displays all the executed instructions. The ULINK*pro* provides ETM. ETM requires a special 20 pin CoreSight connector. ETM also provides Code Coverage and Performance Analysis.
- 10. **ETB:** Embedded Trace Buffer: A small amount of internal RAM used as an ETM trace buffer. This trace does not need a specialized debug adapter such as a ULINK*pro*. ETB runs as fast as the processor and is especially useful for very fast Cortex-A processors. Not all processors have ETB. See your specific datasheet.
- 11. **MTB:** Micro Trace Buffer. A portion of the device internal RAM is used for an instruction trace buffer. Only on Cortex-M0+ processors. Cortex-M4 and Cortex-M7 processors provide ETM trace instead.
- 12. **Hardware Breakpoints:** The Cortex-M0+ has 2 breakpoints. The Cortex-M3, M4 and M7 usually have 6. These can be set/unset on-the-fly without stopping the processor. They are no skid: they do not execute the instruction they are set on when a match occurs. The CPU is halted before the instruction is executed.
- 13. WatchPoints: Both the Cortex-M0, M0+, Cortex-M3, Cortex-M4 and Cortex-M7 can have 2 Watchpoints. These are conditional breakpoints. They stop the program when a specified value is read and/or written to a specified address or variable. There also referred to as Access Breaks in Keil documentation.

œ.,

#### **Read-Only Source Files:**

Some files in the Project window will have a yellow key on them: This means they are read-only. This is to help unintentional changes to these source files. This can cause difficult to solve problems. Most of these files will not need any modification.

If you need to modify one, you can use Windows Explorer to modify its permission.

- 1. In the projects window, double click on the file to open it in the Sources window.
- 2. Right click on its source tab and select Open Containing folder.
- 3. Explorer will open with the file selected.
- 4. Right click on the file and select Properties.
- 5. Unselect Read-only and click OK. You are now able to change the file in the  $\mu$ Vision editor.
- 6. It is a good idea to make the file read-only when you are finished modifications.

Super TIP: µVision icon meanings are found here: www.keil.com/support/man/docs/uv4/uv4 ca filegrp att.htm

## Part A: Connecting and Configuring Debug Adapters to the Kinetis Tower board:

### 1) P&E OSJTAG configuration for the NXP Tower board:

#### If you are using any Keil ULINK or J-Link as your debug adapter: you can skip this page:

µVision supports OSJTAG. This allows debugging the Kinetis Tower with a USB cable. No external adapter is required. MDK contains the P&E drivers located in C:\Keil v5\ARM\PEMicro. You usually need to install them initially. See Step 4.

If you decide to use a ULINK2 or ULINK-ME, you will get Serial Wire Viewer (SWV). With a ULINKpro, ETM Trace is added which records all executed instructions and provides Code Coverage, Execution Profiling and Performance Analysis.

#### Start µVision, select the RTX Blinky Project and install the P&E drivers:

- 1. Start µVision by clicking on its desktop icon. N
- 2. Select Project/Open Project.
- 3. Select the Blinky.uvprojx project in C:\00MDK\Boards\Freescale\TWR-K60D100M\RTX Blinky.
- 4. Using Microsoft Explorer, navigate to C:\Keil\_v5\ARM\PEMicro\Drivers and execute PEDrivers\_install.exe.
- 5. Plug the K60 board to your PC with a USB cable to J17 USB.

#### **Create a new Target Selection:**

- 1. Select Project/Manage/Project Items...
- 2. In the Project Targets area, select NEW in or press your keyboard INSERT key.
- 3. Enter **PE Flash** and press Enter. Click OK to close this window.
- In the Target Selector menu, select the PE Flash selection you just made: 4.
- Select Options for Target <sup>M</sup> or ALT-F7. Click on the Debug tab to select a debug adapter. 5.
- 6. Select PEMicro Debugger... as shown here:

#### **Configure the P&E Connection Manager:**

- 1. Click on Settings: and the P&E Connection Manager window opens.
- Click the Select New Device box, and select your exact processor. In this 2. case it is K60DN512M10 as shown below: This step is very important.
- Select Use SWD reduced pin protocol for communications... (optional) 3.
- Click on the Refresh List and you will get 4. a valid Port box as shown here:
- 5. This means µVision is connected to the target K60 using P&E OSJTAG.
- 6. Click on OK to close this window.
- 7. If you see **Undetected** in Port:, this means µVision is not connected to the target. Problems can be the K60 board is not connected with USB, or wrong or no or the wrong device is selected. Fix the problem and click Refresh List to try again.
- 8. Click the Utilities tab. The next step prevents the Flash being programmed twice when entering Debug mode.

Device Selection

Architecture: ABM

Device: K60DN512M10

Connection port and Interface Type

- 9. Unselect Update target before Debugging in the Utility tab. Click OK to return to the main µVision menu.
- 10. Select File/Save All or click 🗾. P&E OSJTAG is now completely configured including Flash programming.

**TIP:** If you are notified that the K60 P&E firmware needs to be updated, allow this. You are given instructions.

**OSJTAG Limitations:** (Any Keil ULINK provides these options. A J-Link provides most of them.)

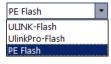

- 1. Hardware Breakpoints can't be set on-the-fly while the program is running. You must stop the program.
- 2. No Watchpoints. No Serial Wire Viewer or ETM Trace support.
- 3. No on-the-fly memory read or write updates to the Watch and Memory windows while the program is running.
- 4. RTX Kernel Awareness window do not update while the program is running. Event Viewer is not available.

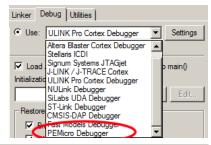

Vendor: Freescale

Port: Undetected, Disconnect/Connect USB cable, Click Refresh List,

Interface: USB Multilink, USB Multilink FX, or Embedded OSJtag

Port: USB1 : Embedded Kinetis OSBDM/OSJTAG Device (SER01)

Family: K6x

### 2) Connecting a ULINK2/ME, ULINKpro or J-Link to the NXP Tower board:

NXP provides the ARM standard 20 pin Cortex Debug connector for JTAG/SWD and ETM connection as shown here:

Pins 1 through 10 provide JTAG, SWD and SWO signals. Pins 11 through 20 provide the ETM instruction trace signals.

ARM also provides a 10 pin standard connector that provides the first 10 pins of the 20 pin but this is not installed on the Kinetis board. ARM recommends that both the 10 and 20 pin connectors be placed on target boards.

Pin 7 on both the 10 and 20 pin is a key. On the male connector, pin 7 is supposed to be absent. This is not the case on the Kinetis board.

Keil cables might have pin 7 filled with a plastic plug and if so this will need to be removed before connecting to the Kinetis target. This is easily done with a sharp needle. Merely pry the plastic pin out.

Alternatively, you can cut pin 7 off the target connector. This is more difficult to do. Cable orientation is provided by the socket itself and there is no chance for reverse orientation.

It is impossible to plug a 10 pin plug into the 20 pin socket without bending two pins on the socket. Please use the correct cables.

#### Connecting ULINK2 or ULINK-ME:

Pictured is the 10 pin to 20 pin Keil connector. The arrows point to pin 1. This cable is supplied with the ULINK2 and ULINK-ME. This cable can also be ordered by contacting Keil sales or tech support. The part number is ULC-2010A or B.

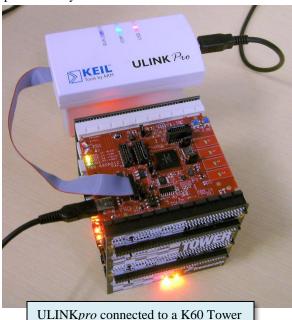

You will need to take the case off the ULINK2 and install the special cable. The ULINK-ME does not have a case and the cable can be directly installed on the 10 pin connector. The ULINK-ME is pictured bottom right and the arrow points the 10 pin connector.

#### Connecting a ULINKpro:

10 to 20 Pin Cable, Pin 1 indicated

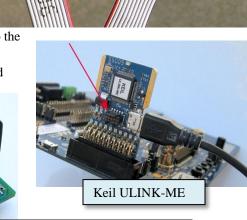

The ULINK*pro* connects directly to the Kinetis board with its standard 20 pin connector. You might need to remove the key pin to connect to the Kinetis target as described above.

**Power:** Power the board with a USB cable as shown below (J17) or the method specified for your board.

20 Pin Cortex Debug Connector

Segger CortexM Connector Adapter

**J-Link:** Segger provides an adapter to go from the large 20 pin connector to the 10 and 20 pin Cortex connectors as shown above. Contact Segger to purchase this adapter: www.segger.com.

**Connector Part Numbers:** The 10 pin male connector as shown on the ULINK-ME is Samtec part number FTSH-105-01. The 20 pin ETM connector as used on the Kinetis boards is: FTSH-110-01. You may want to add appropriate suffixes for guide options.

**TIP:** Want to purchase some of the connectors used on the Tower system ? They are actually standard 32 bit PCI sockets as used on personal desktop computers. These connectors are easy to find.

10

### Part B: Keil Example Projects

### 1) RTX\_Blinky example program:

We will run the example program RTX\_Blinky on K60D100M Tower board using a ULINK2, ULINKpro or a J-Link.

It is possible to use the P&E OSJTAG with this example. You must configure this as described on page 8. No hardware debug adapter is needed in this case. If you want to use a Segger J-Link, configure it similar to the P&E example.

#### **Connect the Debug Adapter:**

- 1. Connect your debug adapter as described on the previous page. Use the special 10 to 20 pin cable for the ULINK2.
- 2. Power your TWR board with a USB cable connected to J17 USB and to your PC.

#### **Open and compile the Blinky Program:**

- K 1. Start µVision by clicking on its desktop icon.
- 2. Select Project/Open Project.
- Open the file C:\00MDK\Boards\Freescale\TWR-K60D100M\RTX\_Blinky\Blinky.uvprojx. 3.
- 4. Select your debug adapter in the Target Options pull down menu box as shown here: ULINK-Flash is for a ULINK2 or a ULINK-ME. ULINKpro-Flash is for a ULINKpro.

**TIP:** If you are using the P&E onboard debug adapter, configure it as shown on page 8. If you are using a J-Link, configure it similarly. In each case, a suitable entry will be created in this menu box you can then select.

5. Compile the source files by clicking on the Rebuild icon.

**TIP:** Select Options for Target and select the Target tab: select MicroLIB to make your compilation smaller.

- Enter Debug mode by clicking on the Debug icon. Select OK if the Evaluation Mode box appears. 6. The Kinetis FLASH memory will be programmed. Progress will be indicated in the Output Window.
- Click on the RUN icon.  $\blacksquare$  Note: you stop the program with the STOP icon. 7.

#### The three LEDs, D7 through D9 on the Kinetis board, will now blink in sequence.

Now you know how to compile a program, load it into the Kinetis processor Flash, run it and stop it.

**TIP:** The board will start Blinky stand-alone. Blinky is now permanently programmed in the Flash until reprogrammed.

### 2) Hardware Breakpoints:

- 1. With Blinky running, click once in the margin in the source file Blinky.c on a darker gray block in the LED\_On function near line 52 as shown here:
- 2. A red circle is created and soon the program will stop here:

**TIP:** If you are using P&E, you must stop the program to set the breakpoint. All other debuggers can set/unset breakpoints on-the-fly.

- 3. The yellow arrow is where the program counter is pointing to in both the Disassembly and appropriate source window.
- 4. The Kinetis has 6 hardware breakpoints. A breakpoint does not execute the instruction it is set on. This is a very important feature.
- 5. If you set too may breakpoints, µVision will warn you.
- Remove any breakpoints by clicking again on the red circle. 6

**TIP:** You can view the Breakpoint list by selecting Debug/Breakpoints or Ctrl-B. Watchpoints are also displayed here.

UlinkPro-Flash

# **3) Call Stack + Locals Window:** (This page works with all debug adapters including P&E) Local Variables:

The Call Stack and Local windows are incorporated into one integrated window. Whenever the program is stopped, the Call Stack + Locals window will display stack contents as well as any local variables belonging to the active function.

If possible, the values of the local variables will be displayed and if not the message <not in scope> will be displayed. The Call + Stack window presence or visibility can be toggled by selecting View/Call Stack window.

- 1. Run  $\square$  and Stop  $\bigotimes$  Blinky. Click on the Call Stack + Locals tab.
- 2. Shown is the Call Stack + Locals window.
- 3. Note os\_idle\_demon is highlighted with a cyan block. This example uses RTX as its RTOS. The CPU spends most of its time in the idle demon. This can be adjusted.
- The contents of local variables are displayed as well as names of active functions. Each function name will be displayed as it is called by another function or interrupt.
- When a function exits, it is removed from the list. When using RTX, all threads are always displayed.
- The first called functions are at the bottom of this table.
- This table is active only when the program is stopped.
- 4. In Blinky.c, there is the function Switch\_On near line 68.
- 5. Set a breakpoint in this function.
- 6. Click on RUN 崖 The program will stop at this point.
- 7. The Call Stack window will display the function calling Switch\_On. It will be highlighted in cyan as shown below: In this example, you can see phaseA called Switch\_On with the parameter led = 0x01.

**TIP:** They are not, but for now, treat RTX threads or tasks as functions. RTX refers to threads as such and not as tasks.

- 8. Click on RUN again. A different function (a thread in this case) will be designated with the cyan block.
- 9. Move the breakpoint to the function LED\_On near line 50. Click on RUN again.
- 10. Now you can see that a function called Switch\_On which in turn called LED\_On. See the picture below:

**TIP:** You can modify a variable value in the Call Stack & Locals window when the program is stopped.

Call Stack + Locals							
Name	Location/Value

#### 4) Watch and Memory Windows and how to use them: (P&E updates at program halt)

The Watch and Memory windows will display updated variables (not local or automatic variables) in real-time. It does this using ARM CoreSight debugging technology that is part of Cortex-M processors. It is also possible to "put" or insert values into memory locations using the Memory window in real-time.

#### a) Create a Global Variable counter and increment it:

- 1. Stop the program  $\bigotimes$  and exit Debug mode.
- 2. In Blinky.c near line 12, create this global variable: **unsigned int counter = 0**;
- 3. In the thread Thread 5 'clock': which is located near line 145, add this code at the end of this thread near line 151:

#### counter++;

#### if (counter > 0x0F) counter = 0;

4. Compile the source files by clicking on the Rebuild icon. 🕮. Enter Debug mode 🍳 Click RUN 📃

#### b) Enter counter in a Watch window:

1. In Blinky.c, right click on any instance of **counter** and select Add counter to ... and select Watch 1.

TIP: You can add a variable to a Watch or Memory window while the program runs only with any Keil ULINK or a J-Link.

2. This action will open the Watch window if it is not already open. **counter** is displayed incrementing as shown here:

**TIP:** You can also block **counter**, click and hold and drag it into Watch 1. You can also enter a variable manually by double-clicking or pressing F2 and using copy and paste or typing the variable name in.

These three methods of entering variables also work with the Memory and Logic Analyzer windows. Variables can also be selected from the Symbol table. This also has the benefit of fully qualifying them (specifying where they are located).

**TIP:** To Drag 'n Drop into a tab that is not active, pick up the variable and hold it over the tab you want to open; when it opens, move your mouse into the window and release the variable.

#### c) Enter counter in a Memory window:

- 1. In Blinky.c, right click on **counter** and this time select Add counter to ... and select Memory 1.
- 2. Note the value of **counter** is displaying its address in Memory 1 as if it is a pointer. This is useful to see what address a pointer is pointing to, but this is not what we want to see at this time.
- 3. Add an ampersand "&" in front of the variable name. Now the physical address is shown (0x2000 0000). Note: the address where **counter** is located might be slightly different in your program but it will be displayed the same way.
- 4. Right click in the Memory window and select Unsigned/Int.
- 5. The data contents of **counter** is displayed as shown here:
- 6. Both the Watch and Memory windows are updated in real-time.
- Right-click on a memory location and select Modify Memory. You can change the value of this location while the program is running. The Watch window can be modified when stopped or data not changing fast.

**TIP:** You are able to configure the Watch and Memory windows while the program is still running in real-time without stealing any CPU cycles. You are able to modify memory location contents in a Memory window in real-time.

TIP: You are not able to view local variables while the program is running. Convert them to static or global variables.

#### How It Works:

 $\mu$ Vision uses ARM CoreSight technology to read or write memory locations without stealing any CPU cycles. This is nearly always non-intrusive and does not impact the program execution timings. Remember the Cortex-M4 is a Harvard architecture. This means it has separate instruction and data buses. While the CPU is fetching instructions at full speed, there is plenty of time for the CoreSight debug module to read or write values without stealing any CPU cycles.

This can be slightly intrusive in the unlikely event the CPU and  $\mu$ Vision reads or writes to the same memory location at exactly the same time. Then the CPU will be stalled for one clock cycle. In practice, this cycle stealing rarely happens.

Memory 1			д	×
Address: &co	unter		L.	-
0x2000000	: 0000000A	20000DC	20000110	
0x20000000	20000144	20000178	200001AC	
0x20000018	: 20000074	200008F0	00000000

Watch 1

### 5) System Viewer (SV): (any ULINK or a J-Link update in real time. P&E updates at program halt)

The System Viewer provides the ability to view certain registers in the CPU core and in peripherals. In most cases, these Views are updated in real-time while your program is running. These Views are available only while in Debug mode. There are two ways to access these Views: **a**) View/System Viewer and **b**) Peripherals/System Viewer. In the Peripheral/Viewer menu, the Core Peripherals are also available:

**TIP:** If you click on a register in the properties column, a description about this register will appear at the bottom of the window as shown above for register PSOR.

SysTick Timer: This program uses the Cortex SysTick timer as the tick timer for RTX RTOS.

- 1. Select Peripherals/Core Peripherals and then select SysTick Timer. Run the program.
- 2. The SysTick window shown below opens:
- 3. Note it also updates in real-time while your program runs using CoreSight DAP technology.
- 4. Note the ST\_RELOAD and RELOAD register contents. This is the reload register value. This is set during the SysTick configuration by RTX using values set in RTX\_Conf\_CM.c.
- 5. Note that it is set to 0xA3D3 = 41,939. This is created by 41.94 MHz/1000-1 = 41,939. 1,000 is specified as the timer tick value in RTX\_Conf\_CM.c. Changing the reload value changes how often the SysTick interrupt 15 occurs.
- 6. In the RELOAD register in the SysTick window, *while the program is running*, type in 0x2000 and click inside ST\_RELOAD ! (or the other way around)
- 7. The blinking LEDs will speed up. This will convince you of the power of ARM CoreSight debugging.
- 8. Replace RELOAD with 0xA3D3. A CPU RESET **Rest** will also accomplish this.
- 9. When you are done, stop the program <sup>№</sup> and close all the System Viewer windows that are open.

System Tick Timer	X
Control & Status ST_CTRL_STAT: 0x00010007	CLKSOURCE
Reload & Current Value	
ST_RELOAD: 0x0000A3D3	RELOAD: 0x00A3D3
ST_CURRENT: 0x00002B96	CURRENT: 0x002B96
Calibration	
ST_CALIB: 0x0000000	TENMS: 0x000000
	SKEW NOREF

TIP: You can also do this exercise with the SysTick window in the System Viewer.

**TIP:** It is true: you can modify values in the SV while the program is running. This is very useful for making slight timing value changes instead of the usual modify, compile, program, run cycle.

You must make sure a given peripheral register allows for and will properly react to such a change. Changing such values indiscriminately is a good way to cause serious and difficult to find problems.

### 6a) Configuring Serial Wire Viewer (SWV) only with ULINK2, ULINK-ME or J-Link:

Serial Wire Viewer provides data trace information including interrupts in real-time without any code stubs in your sources. These instructions are for a ULINK2, ULINK-ME or a J-Link. They are not for ULINK*pro*: those are on the next page. Configure SWV:

- 1. µVision must be stopped and in Edit mode (not Debug mode). RTX\_Blinky must be loaded.
- 2. For ULINK2/ME: select ULINK-Flash: ULINK-Flash For J-Link, configure a new Options for Target.
- 3. Select Options for Target 🔊 or ALT-F7 and select the Debug tab. Your debugger must be displayed beside Use:.
- 4. Select Settings: Settings on the right side of this window.

Trace Exceptions

Event Counters

- 5. Confirm Port: is set to SW and SWJ box is enabled for SWD operation. SWV will not work with JTAG.
- 6. Click on the Trace tab. The window below is displayed.
- 7. In Core Clock: enter 41.94 MHz. Select Trace Enable. This value *must* be set correctly to your CPU speed.
- 8. Click on OK twice to return to the main µVision menu. SWV is now configured and ready to use.

#### **Display Trace Records:**

- 1. Select File/Save All or click 🗐.
- 2. Rebuild the source files.
- 3. Enter Debug mode.
- 4. Click on the RUN icon.
- Open Trace Records window by clicking on the small arrow beside the Trace icon and select Records: <a href="https://www.window.org">window.by</a> clicking on the small arrow beside the Trace icon
- 6. The Trace Records window will open:
- 7. Double-click inside Trace Records to clear any spurious first frames.
- 8. Exception 15 is the SYSTICK timer. It is a timer provided for RTOS use.
- 9. All frames have a timestamp displayed.
- 10. Exception Return means all exceptions have returned. This can be used to detect Cortex exception tail-chaining.
- 11. Right click in Trace Records and unselect Exceptions. Now, only ITM frames are displayed.
- 12. Note the "X" in the Dly column. This is the result of SWV overload.
- 13. Select the Trace Exception tab or select it in Step 4 above. Click in the Count column heading to display SysTick.
- 14. Unselect EXTRC: C EXCTRC: Exception Tracing

15. Double click inside the Trace Records window and the "x" in DLY column will go away. Exception frames are no longer being captured and the bus load is less on the single bit SWO pin. There are probably no overload indicators (x) now.

16. If SVCalls were not incrementing in the Trace Exceptions window: Select Debug/Debug Settings to open Trace Confg window. Select Trace tab. Unselect ITM Port 31. Select EXCTRC. Click OK twice. Click RUN after Notification box. SVCall will now update correctly. The ITM 31 frames were causing the SvCall to not increment.

### 6b) Using Serial Wire Viewer (SWV) with ULINKpro: (using the 4 bit Trace Port)

- 1) Configure SWV: (You can also use the SWO port with the ULINK*pro*. See the first and very last TIP: below.)
  - 1. µVision must be stopped and in Edit mode (not Debug mode). RTX\_Blinky must be loaded.
  - 2. Connect a ULINKpro to the J16 OSJTAG connector and to your PC USB Port.
  - 3. Select ULINK*pro*: UlinkPro-Flash The ULINK*pro* settings are preconfigured with this Target Option.
  - 4. Select Options for Target 🔊 or ALT-F7 and select the Debug tab.

  - 6. Select Settings: Settings on the right side of this window.
  - 7. Click on the Trace tab. The window below is displayed. Confirm these settings are correct.
  - 8. Core Clock: 41.94 MHz. ULINK*pro* uses this only to calculate timings displayed in various windows.
  - 9. Select the Trace Enable box.
  - 10. Unselect ETM Trace Enable (will look at this later).
  - 11. In Trace Port, select Sync Trace Port with 4-bit Data.
  - 12. Select EXTRC to display exceptions and interrupts.
  - 13. Click on OK twice to return to the main  $\mu$ Vision menu. SWV is now configured and ready to use.
  - 14. In this configuration, SWV data will be output on the 4 bit Trace Port rather than the 1 bit SWO pin.
- TIP: If Serial Wire Output Manchester is chosen in Trace Port: box, SWV data is sent out the one bit SWO pin.

#### 2) Display the Trace Data window:

- 1. Select File/Save All or click 🗾. Click on the Rebuild icon to build the source files.
- 2. Enter Debug mode. Q Click on the RUN icon.
- 3. Open Trace Data window by clicking on the small arrow beside the Trace icon:
- 4. The Trace Data window shown below will open.
- 5. STOP  $\bigotimes$  the program to display the Exceptions as shown below:
- 6. In the Search box, enter svcall and press Enter. svcall These exceptions will be highlighted.
- 7. In the Display: box, select ITM Stimulus.

#### **TIPS:**

- 1. The Trace Data window is different than the Trace Records window provided with ULINK2.
- 2. Clear the Trace Data window by clicking
- 3. The contents of the Trace Data window can be saved to a file.
- 4. ULINK*pro* does not update the Trace Data window while the program is running.
- The Trace Exceptions window updates in realtime. Select the Trace Exceptions window to see the SysTick and SVCall updated while running Blinky. Double click in the Count colu

Trace Data				¢ ×
Display: All		- 🛛 🖬 🕱 🖉	) 🙀 p:31	· in
Time	Address / Port	Instruction / Data	Src Code / Trigg	Function

•		,		

Now the ITM Port 31 frames are displayed.

running Blinky. Double click in the Count column heading to bring SysTick and SVCall to the top.

6. The Trace Port outputs SWV data faster than the 1 bit SWO with UART (ULINK2) or Manchester with ULINK*pro*. The 1 bit SWO port can still be useful for very high CPU speeds that ETM is unable to handle. (>100MHz)

Event Counters

### 7) Using the Logic Analyzer (LA) with ULINK2, ULINK-ME, ULINKpro or J-Link:

This example will use the ULINK2, ULINK*pro* or a J-Link with the Blinky example. Please connect a your debug adapter to your Kinetis board and configure it for Serial Wire Viewer (SWV) trace as described on the previous pages.

 $\mu$ Vision has a graphical Logic Analyzer (LA) window. Up to four variables can be displayed in real-time using the Serial Wire Viewer as implemented in the Kinetis. This is shared with the Watchpoints.

- 1. SWV must be configured as found on the two previous pages for the debug adapter you are using.
- 2. Run the program. I. Recall you can configure the LA while the program is running or stopped.
- 3. Open View/Analysis Windows and select Logic Analyzer or select the LA window on the toolbar.
- 4. Locate the global variable **counter** in Blinky.c. It is declared near line 12.
- 5. Right click on **counter** and select Add counter to... and select Logic Analyzer.

**TIP:** If an error results when adding counter to the LA, the most probable cause is SWV is not configured correctly.

- 6. In the LA, click on Setup and set Max: in Display Range to 0x0F. Click on Close.
- 7. The LA is now configured to display counter in a graphical format.
- 8. counter should still be in the Watch and Memory windows. It will be incrementing if the program is running.
- 9. Adjust the Zoom OUT icon in the LA window to about 1 sec or so to get a nice ramp as shown below.
- 10. In the Memory 1 window, right click on the **counter** data field.
- 11. In Modify Memory at 0x2000 0000, at an interesting counter value, enter 0 and press Enter.
- 12. This modified value will be displayed in the LA window as shown below inside the blue circle:

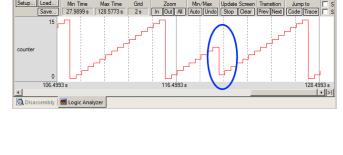

TIP: The Logic Analyzer can display static and global variables, structures and arrays. It can't see locals: just make them static or global. To see peripheral registers, enter them into the Logic Analyzer and write data to them.

- 1. Select Debug/Debug Settings. Select the Trace tab.
- 2. Select On Data R/W Sample. Click OK twice. This adds addresses to the Src Code/Trigger Addr column.
- Clear the Trace Data or Trace Records window.
   Double click for ULINK2 or for ULINK*pro*:
- 4. RUN the program.  $\blacksquare$  STOP  $\bigotimes$  the program.
- 5. Open the Trace Data or Records window.
- 6. The window similar to here opens up:
- 7. In the Display box, select ITM Data Write:

If using a ULINK*pro*, in the Trace Data

9.

8. The first line in *this* Trace Data window means: The instruction at 0x0000 0784 caused a write of data 0x03 to address 0x2000 0000 at the listed time in seconds.

Trace Data						φ×

•			1			

window, double click on a data write frame and the instruction causing this write will be highlighted in the Disassembly and the appropriate source windows.

**TIP:** The Src Code/Trigger Addr column is activated when you selected On Data R/W Sample in Step 2. You can leave this unselected to save bandwidth on the SWO pin if you are not interested in it. With a ULINK2, this column is called PC.

TIP: The ULINK2 gives a different Trace window. It is the same Trace Records as shown elsewhere in this document.

**TIP:** Raw addresses can also be entered into the Logic Analyzer. An example is: \*((unsigned long \*)0x2000000)

#### 8) Watchpoints: Conditional Breakpoints: Only with a ULINK2, ULINK-ME, ULINKpro or J-Link.

Kinetis Cortex-M4 processors have one Watchpoint. Watchpoints can be thought of as conditional breakpoints. The Logic Analyzer uses the same CoreSight components as Watchpoints in its operations. A Watchpoint requires two of the four comparators. Keil documentation often refers to Watchpoints as Access Breaks.

 $\mu$ Vision warns you if you attempt to set more than one Watchpoint. SWV or ETM do not need to be configured and any ULINK or J-Link can be used for Watchpoints. P&E OSJTAG does not support Watchpoints.

- 1. Use the Blinky example from the previous page. You can set a Watchpoint while the program is running.
- 2. While in Debug mode, click on Debug and select Breakpoints or press Ctrl-B.
- 3. The SWV Trace does not need to be configured for Watchpoints. However, we will use it in this exercise.
- 4. In the Expression box enter: counter == 0x8. Select both the Read and Write Access for convenience.
- 5. Click on Define and it will be accepted as shown here:
- 6. If the program is running and when counter = 0x8, the program will stop as the Watchpoint is immediately set.
- 7. Click on Close.
- 8. With ULINK2, double-click in the Trace Records window to clear it or with ULINK*pro* click **x** to clear Trace Data for convenience.
- 9. Set **counter** in the Watch 1 or Memory 1 window to 1. This is to allow the program to run for a bit.
- 10. Click on RUN.
- 11. When **counter** equals 0x8, the program will stop. This is how a Watchpoint works.

Breakpoints		×
Current Breakpoints:		
✓ 00: (A readwrite 0x20000000 len=4), 'counter == 0x8',		
4		F
	Access	
Expression: counter == 0x8	Read	✓ Write
Count: 1	Size:	
Command:	1 🚔	Bytes
Command.		Objects
Define Kill Selected Kill All Cla	se	Help

- 12. You will see counter had incremented in the Logic Analyzer as well as in the Watch window.
- 13. Note the four data writes in the Trace Records window shown below. The last one is when counter = 0x08. The data writes to **counter** are shown plus the address the data written to and the PC of the write instruction. This is with a ULINK2 or ULINK-ME. The ULINK*pro* will display a different window and the program must be stopped to display it. This is also true for the J-Link.

race Records									
Туре	Ovf	Num	Address	Data	PC	Dly	Cycles	Time[s]	
Data Write			2000000H	0000005H	00000784H		1408821586	33.59135875	٦
Data Write			20000000H	0000006H	00000784H		1429791586	34.09135875	
Data Write			20000000H	0000000711	00000784H		1450761586	34.59135875	
Data Write			20000000H	0000008H	00000784H		1471731586	35.09135875	

TIP: Data writes are displayed in the SWV Trace window *only* when a variable is displayed in the Logic Analyzer.

- 14. The only type of expressions you can currently enter is the equal compare (==) and address only compare.
- 15. To repeat this exercise, select RUN twice to get counter past 8.
- 16. When finished, open the Breakpoints window and either use Kill All to delete the Watchpoint or deselect it by unchecking it. Having undeleted Watchpoints activate unexpectedly can be rather confusing while debugging.
- 17. Leave Debug mode  $\bigcirc$  for the next exercise.

**TIP:** To edit a Watchpoint, double-click on it in the Breakpoints window and its information will be dropped down into the configuration area. Unselect the Watchpoint Current Breakpoints window. Modify the Watchpoint. Click on Define to create another Watchpoint. You probably should delete the old one by highlighting it and click Kill Selected.

**J-Link** does not currently display Data reads or writes in its trace window and the LA does not display with Watchpoints. P&E OSJTAG does not currently support Watchpoints.

#### 9) Exceptions and Interrupts using SWV: Only with ULINK2, ULINKpro or J-Link. Not P&E.

The Kinetis family using the Cortex-M4 processor has many useful interrupts and SWV makes it easy to determine when and how often they are being activated. Interrupts are a subset of Exceptions. This page assumes you are using a ULINK2.

Exceptions are enabled in SWV by EXCTRC in the Trace Config or Trace Exception windows:

- Click Options for Target: is If using a ULINKpro, you can skip steps 2 through 4. 1.
- Select the Debug tab and then click the Settings box. Select the Trace tab. 2.
- Unselect ITM 31 to lessen the output on the SWO pin to lessen trace data overflows: 3. This turns the Event Viewer off. None of its data is output on the SWO pin.
- Click on OK twice to return to the main µVision menu. 4.
- Open the Trace Records window. 5.
- If you are using a ULINKpro or J-Link, this name is Trace Data. 6.
- Double click in the Trace Records window to clear it or use it with ULINKpro. 7.
- 8. Click RUN to start the program.
- You will see a window similar to the one here with Exce 9.

**TIP:** With a ULINK*pro* or a J-Link, stop the program to see these exceptions. They are displayed differently.

### What Is Happening ?

- 1. You can see SysTick Exception 15 occurrences with timestamps.
- 2. **Entry:** When the exception enters.
- 3. Exit: When the exception exits or returns.
- Return: When all the exceptions have returned. This is useful to detect tail-chaining. 4.

**TIP:** Num is the exception number: RESET is 1. External interrupts (ExtIRQ), which are normally attached to peripherals, start at Num 16. For example, Num 41 is also known as 41-16 = External IRQ 25. Num 16 = 16 - 16 = ExtIRQ 0.

Trace R

Exception

2. Right click in the Trace Records window and unselect Exceptions. Now the data writes from the LA are displayed.

TIP: The SWO pin is one pin on the Cortex-M4 family processors that all SWV information is fed out. There are limitations on how much information we can feed out this one pin. ULINKpro has the option of sending this data out the 4 bit Trace Port with much greater throughput tan the SWO pin. ULINKpro handles SWV data faster than a ULINK2 or J-Link.

### **Trace Exceptions window:**

- 1. Select the Trace Exceptions tab and the window below opens:
- Click in the Count column heading to bring exceptions that have occurred to the top. Exceptions 15 and 11 will be 2. displayed and are updated in real time without intrusions to your program using SWV.
- Note the number of times these have happened. This is useful information in case interrupts come too fast or slow. 3.

### 10) printf using ITM 0 (Instrumentation Trace Macrocell) SWV is required:

Recall that we showed how you can display information about the RTOS in real-time using the RTX Viewer. This is done through ITM Stimulus Port 31. ITM Port 0 is available for a *printf* type of instrumentation that requires minimal user code. After the write to the ITM port, zero CPU cycles are required to get the data out of the processor and into  $\mu$ Vision for display in the Debug (printf) Viewer window. It is possible to send ITM data to a file: <u>www.keil.com/appnotes/docs/apnt\_240.asp</u>.

1. Stop the program  $\bigotimes$  and exit Debug mode  $\bigotimes$ .

#### Add STDOUT File (retarget\_io.c):

- 2. Open the Manage Run-Time Environment window (MRTE)
- 3. Expand Compiler and I/O as shown here:
- 4. Select STDOUT and ITM. This adds the file retarget\_io.c to the project.
- 5. Ensure all blocks are green and click OK to close the MRTE.

#### Add printf and #include <stdio.h> to Blinky.c:

- 1. In Blinky.c near line 13, add this line: #include <stdio.h>
- 2. Inside the function Switch\_On found near line 68, add this line: printf("LED %d On\n", led);
- 3. Inside the function Switch\_Off found near line 77, add this line: printf("LED %d Off\n", led);

#### Enable Microlib and Configure Serial Wire Viewer:

- 1. Select Options for Target 🔊 or ALT-F7. Select the Target tab.
- 2. Select Use MicroLIB. If you don't want to use MicroLIB add 200 bytes to the Heap in startup\_MK60D10.s.
- 3. Select the Debug tab. Select Settings and then the Trace tab.
- 4. Unselect On Data R/W Sample and ITM Port 31. (this is to help not overload the SWO pin so this step is optional)
- 5. Select ITM Port 0. ITM Stimulus Port "0" enables the Debug (prinftf) Viewer. All ports 1 through 30 are unused.
- 6. Click OK twice to return to the main  $\mu$ Vision menu.

#### Increasing RTX stack size:

When a printf statement is added to a thread, you must increase the RTX stack size as follows:

- 1. Select the RTX\_Conf\_CM.C tab. Click on the Configuration Wizard tab at the bottom of this window.
- 2. Set the Default and Main stack size to 400 bytes as shown here:
- 3. In general, if you experience trouble with RTX operation, try increasing the number of threads and size of the RTX stack. This stack is not the same as the CPU system stack as referenced by the Stack Pointer but is still in RAM.

#### **Compile and Run the Project:**

- 7. Select File/Save All or click 🗐
- 8. Rebuild the source files  $\overset{\text{lim}}{=}$  and enter Debug mode  $\overset{\text{Q}}{=}$ .
- 9. Click on View/Serial Windows and select Debug (printf) Viewer and click on RUN.
- 10. In the Debug (printf) Viewer you will see the printf statements appear.
- 11. Right click on the Debug window and select Mixed Hex ASCII mode. Note other settings.

#### Obtaining a character typed into the Debug printf Viewer window from your keyboard:

It is possible for your program to input characters from a keyboard with the function ITM\_ReceiveChar in core.CM4.h.

This is documented here: www.keil.com/pack/doc/CMSIS/Core/html/group i t m debug gr.html.

A working example can be found in the File System Demo in Keil Middleware. Download this using the Pack Installer.

TIP: ITM\_SendChar is a useful function you can use to send characters out ITM. It is found in core.CM4.h.

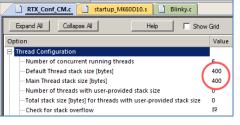

**TIP:** It is important to select as few options in the Trace configuration as possible to avoid overloading the SWO pin. Enable only those SWV features that you need. If you need high performance SWV, a ULINK*pro* using 4 bit Trace Port is fastest.

### 11) Trace Configuration Fields and General Trace Information:

For ULINK2 see <u>www.keil.com/support/man/docs/ulink2/ulink2 ctx trace.htm</u> For ULINK*pro* see <u>www.keil.com/support/man/docs/ulinkpro/ulinkpro ctx trace.htm</u> For Segger J-Link see http://www.keil.com/support/man/docs/jlink/jLink cortexTrace.htm

#### **SWO Overload:**

Serial Wire Viewer data (frames) are output on the 1 pin SWO with a ULINk2 or J-Link. This pin is located on 13 on the 20 pin legacy connector (not on Tower boards). It is also available on the 10 or 20 pin CoreSight Debug connectors. SWO is on pin 6 on the 10 pin and pin 14 on the 20 pin. SWO is multiplexed with JTAG TDO pin. This means SWD (Serial Wire Debug) must be used and not JTAG mode. This is easily set in  $\mu$ Vision. SWD = SW in  $\mu$ Vision.

SWO is one pin and it can be challenging to send a large amount of SWV data through it. A ULINK*pro* using Manchester mode on the SWO pin is more efficient. For even more throughput, ULINK*pro* can output SWV on the 4 bit Trace Port. This port is available on most NXP Cortex-M3, M4 and M7. Cortex-M0 does not have SWV nor the Trace Port. It does have DAP.

It is important to ensure the Serial Wire Output (SWO) pin is not overloaded.  $\mu$ Vision will alert you when an overflow occurs with an "X" in the Trace Records window or with a "D" or a "O" in the ULINK*pro* Trace Data window.  $\mu$ Vision easily recovers from these overflows and immediately continues displaying the next available trace frame. Dropped frames are somewhat the normal situation especially with many data reads and/or writes.

Variables entered in the LA with the resulting Data writes to the Trace Records window plus exceptions and interrupts create a trace frame each time there is an event. You may have to sample a rapidly changing variable.

ULINK*pro* can process SWV information much faster than the ULINK2 or ULINK-ME can. This results in fewer dropped frames especially with higher data transfer rates out the SWO pin. ULINK*pro* has the option of collecting information from the 4 bit Trace Port instead of the 1 bit SWO pin. Data overruns are often associated with a fast stream of data reads and writes which are created in the Logic Analyzer. Minimize these issues by displaying only the information you really need or use a ULINK*pro* with UART Manchester or better the 4 bit Trace Port.

### PART C): DSP Example using ARM CMSIS-DSP Libraries:

### 1) DSP SINE example:

ARM CMSIS-DSP libraries are offered for ARM Cortex-M0, Cortex-M3, Cortex-M4 and Cortex-M7 processors. DSP libraries are provided in MDK in C:\Keil\_v5\ARM\Pack\ARM\CMSIS\ and <u>www.keil.com/pack/doc/cmsis/DSP/html/</u> See <u>www.arm.com/cmsis</u>, <u>http://community.arm.com/groups/tools/content</u> and <u>https://github.com/ARM-software/CMSIS\_5</u>.

You can use this example with other Kinetis boards. You might need to make some changes to the startup and system files.

This example creates a *sine* wave, then creates a second to act as *noise*, which are then added together (*disturbed*), and then the noise is filtered out (*filtered*). The waveform in each step is displayed in the Logic Analyzer using Serial Wire Viewer.

This example incorporates the Keil RTOS RTX. RTX has a BSD (soon Apache 2) license. Source code is provided.

This program will run with P&E but to see the interesting and useful SWV features you need any ULINK or a J-Link.

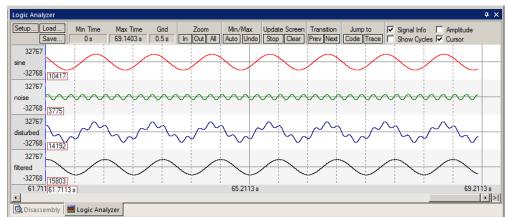

- 1. This program was copied to C:\Keil\ARM\Boards\Freescale\TWR-K60D100M\DSP on page 5.
- 1. Open the project file sine.uvprojx with µVision. Connect a ULINK2, ULINKpro or J-Link to the K60 TWR board.
- 2. Select your debug adapter from the pull-down menu as shown here:
- 3. Compile the source files by clicking on the Rebuild icon.
- 4. Enter Debug mode by clicking on the Debug icon. The Flash will be programmed. Select OK if the Evaluation Mode notice appears.

TIP: The default Core Clock: is 41.94 MHz for use by the Serial Wire Viewer configuration window in the Trace tab.

- 1. Click on the RUN icon. 📃 Open the Logic Analyzer window.
- 2. This project has Serial Wire Viewer configured and the Logic Analyzer and Watch 1 loaded with the four variables.
- 3. Four waveforms will be displayed in the Logic Analyzer using the Serial Wire Viewer as shown below. Adjust Zoom for an appropriate display. Displayed are 4 global variables: sine, noise, disturbed and filtered.

**Trouble:** If one or two variables displays no waveform, disable ITM Stimulus Port 31 in the Trace Config window. The SWO pin is probably overloaded if you are using a ULINK2. ULINK*pro* handles SWV data faster than a ULINK2 or J-Link can. Make sure the Core Clock is set to 41.94. If the variables in Watch 1 are changing, the program is running correctly.

- Select View/Watch Windows and select Watch 1. The four variables are displayed updating as shown below:
- 5. Open the Trace Records window and the Data Writes to the four variables are displayed using Serial Wire Viewer. When you enter a variable in the LA, its data write is also di

its data write is also displayed in the Trace window. With ULINK*pro* you must stop the program to display the data Trace Data window. J-Link does not display any data read or write operations. P&E has no SWV or ETM support.

- 6. Select View/Serial Windows/Debug (printf) Viewer. printf data is displayed from printf statements in DirtyFilter.c. See page 18 for a description using printf and ITM.
- 7. Leave the program running.
- 8. Close the Trace Records window.

Watch 1 X

PE OSJTAG

### 2) Signal Timings in Logic Analyzer (LA):

- 1. In the LA window, select Signal Info, Show Cycles, Amplitude and Cursor.
- 2. Click on STOP in the Update Screen box. You could also stop the program but leave it running in this case.
- 3. Click somewhere interesting in the LA to set a reference cursor line.
- 4. Note as you hover the cursor various timing information is displayed as shown below:

### 3) RTX Tasks and System Awareness window:

- 5. Click on Start in the Update Screen box to resume the collection of data. The program must be running.
- 6. Open Debug/OS Support and select RTX System and Thread Viewer. A window similar to below opens up. You may have to click on its header and drag it into the middle of the screen to comfortably view it.
- 7. As the various threads switch state this is displayed. Note most of the CPU time is spent in the idle daemon: it shows as Running. The processor spends relatively little time in other tasks. You will see this illustrated clearly on the next page. It is possible to adjust these timings to give more CPU time to various threads.
- 8. Set a breakpoint in each of the four tasks in DirtyFilter.c by clicking in the left margin on a grey area. Do not select while(1) as this will not stop the program.
- 9. Click on Run and the program will stop here and the Task window will be updated accordingly. In the screen below, the program stopped in the noise\_gen task:
- 10. Clearly you can see that noise\_gen was Running when the breakpoint was activated.
- 11. Each time you click on RUN, the next task will display as Running.
- 12. Remove all the breakpoints by clicking on each one. You can use Ctrl-B and select Kill All.

**TIP:** You can set/unset hardware breakpoints while the program is running.

**TIP:** Recall this window uses the CoreSight DAP read and write technology to update this window. Serial Wire Viewer is not used and is not required to be activated for this window to display and be updated.

Property	Valu	e							
System	Item			Value					
	Tick T	Tick Timer:			iSec				
	Rour	nd Robin Timeout:		5.000 n	iSec				
	Defa	ult Thread Stack Size:		200					
	Threa	ad Stack Overflow Chec	k:	Yes					
	Threa	ad Usage:		Availab	le: 6, Used	1:6 + 0			
- Threads	ID	Name					Event Value	Event Mask	
	1	main	Normal	I V	/ait_DLY				32%
	2	sinc_gen	Normai	-	(oit_DLY	1	0x0000	0x0001	44%

	255	os_idle_demon	None	R	eady				32%
•									

The Event Viewer does use SWV and this is demonstrated on the next page.

### 4) RTX Event Viewer (EV):

1. *If you are using a* ULINK*pro, skip this step unless you want to see SWV overload.:* Stop the program. Click on Setup... in the Logic Analyzer. Select Kill All to remove all variables and select Close. This is necessary because the SWO pin will likely be overloaded when the Event Viewer is opened up. Inaccuracies might occur.

- 2. Select Debug/Debug Settings.
- 3. Click on the Trace tab.
- 4. Enable ITM Stimulus Port 31. Event Viewer uses this port to collect its information.
- 5. Click OK.
- 6. Click on RUN 🖳
- Open Debug/OS Support and select Event Viewer. The window here opens up:

and re-enter Debug mode. 🍳 🍳

#### Main Thread:

1. Select Stop in the Update Screen. Scroll to the beginning of the Event Viewer.

Save...

sine\_gen (2)

noise\_gen (3)

disturb\_gen (4)

filter\_tsk (5)

sync\_tsk (6)

Idle (255)

55.4693 s

2. The first thread in this program was main() as depicted in the Event Viewer. The main thread is the main() function in DirtyFilter.c It runs some RTX initialization code at the beginning and is stopped with osDelay(osWaitForever);.

**TIP:** If Event Viewer is blank or erratic, or the LA variables are not displaying or blank: this is likely because the Serial Wire Output pin is overloaded and dropping trace frames. Solutions are to delete some or all of the variables in the Logic Analyzer to free up some SWO or Trace Port bandwidth. Try turning off the exceptions with EXTRC.

- 3. The 5 running threads plus the idle daemon are displayed on the Y axis. Event Viewer shows which thread is running, when and for how long.
- 4. Click Stop in the Update Screen box.
- 5. Click on Zoom In so three or four threads are displayed as shown here:
- 6. Select Cursor. Position the cursor over one set of bars and click once. A red line is set here:
- 7. Move your cursor to the next set and total time and difference are displayed.
- 8. Since you enabled Show Cycles, the total cycles and difference is also shown.

The 10 msec shown is the SysTick timer value which is set in RTX\_Conf\_CM.c in the OS\_CLOCK and OS\_TICK variables.

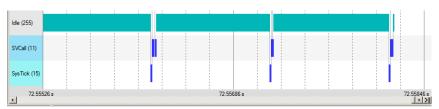

### Using a Keil ULINKpro:

**SWV Throughput:** ULINK*pro* is much better with SWO bandwidth issues. These have been able to display both the EV and LA windows. See page 19. The ULINKpro ETM and ULINKpro UART are preconfigured Options for Target.

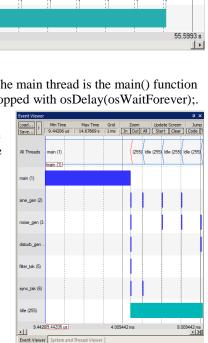

ULINK*pro* can also use the 4 bit Trace Port for even faster operation for SWV. Trace Port use is mandatory for ETM trace. A ULINK*pro* in ETM mode provides program flow debugging, Code Coverage and Performance Analysis. ULINK*pro* also supports ETB (Embedded Trace Buffer) as found in many Kinetis processors.

24

**Exceptions:** A ULINK*pro* displays exceptions at the bottom of the Event Viewer. Shown here are the SysTick and SVCall exceptions. You can easily measure the duration of the time spent in the handlers. Any other exception events such as DMA will also be displayed here.

You will be able to easily measure the time a handler runs with Event Viewer techniques you have learned.

## Part D) ETM Trace only with Keil ULINK*pro*: Introduction:

The examples shown previously with the ULINK2 will also work with the ULINKpro. There are two major differences:

- 1) The window containing the trace frames is now called Trace Data. More complete filtering is available.
- 2) The SWV (Serial Wire Viewer) data is sent out the 1 bit SWO pin with the ULINK2 using UART encoding. The ULINK*pro* can send SWV data *either* out this same SWO pin using Manchester encoding or through the 4 bit Trace Port. This allows ULINK*pro* to support those Cortex-M processors that have SWV but not ETM and have no Trace Port. The Trace Port is found on the 20 pin Cortex connector and is configured in the Trace configuration window. ETM frames are always sent out the Trace Port and if this is the case, SWV data is also sent out this port. **ETB:** ULINKpro can access the Embedded Trace Buffer (ETB) which is an on-chip instruction trace buffer. See the bottom of the next page for more information.

#### ULINKpro offers:

- 1) Faster Flash programming than the ULINK2.
- 2) Serial Wire Viewer frames are provided at a much faster data throughput than a ULINK2 or J-Link.
- 3) ETM Instruction Trace is added which provides a record of all executed instructions. The Trace Data window has Trace start and stop, filtering and ability to save records to a file.
- 4) Code Coverage: were all the assembly instructions executed ? This data can be saved as a report.
- 5) Performance Analysis: where the processor spent its time in graphical and numeical formats.
- 6) **Execution Profiling**: How long instructions, ranges of instructions, functions or C source code took in both time and CPU cycles as well as number of times these were executed.

If you are a power user of Serial Wire Viewer and have problems with SWV signal overloads, a ULINK*pro* is an excellent investment. A ULINK*pro* is worth the small cost and is easy to operate and analyze the results to obtain useful information.

### 1) Configuring ULINKpro ETM Trace:

#### **Configuring the Connection:**

- 1. Connect a ULINKpro to the OSJTAG J1 CoreSight ETM connector. Power the board and ULINKpro.
- 2. The ULINKpro is configured for SWV and ETM operation using the Trace Port in RTX\_Blinky example.

#### .ini File:

A script must be executed upon entering Debug mode to configure the ETM registers and GPIO ports. This script is provided as TracePort.ini and is found in C:\Keil\ARM\Boards\Freescale\TWR-K60D100M\RTX\_Blinky\. This is an ASCII file. This file is specific to Kinetis processors as their proprietary GPIO ports must be configured. Note other Kinetis processors might need a different .ini file depending on the pins the Trace Port is located.

#### **Entering the Initialization File:**

- $1) Select Project/Open Project. Open C: \end{tabular} Boards \Freescale \TWR-K60D100M \RTX_Blinky.uvprojx.$
- 2) Select "UlinkPro-Flash": ULinkPro-Flash The ULINK*pro* is pre-configured as the debug adapter.
- 3) Click on the Target Options icon is or select "Project/Options for Target" or press Alt+F7.
- 4) Click on the Debug tab. Confirm TracePort.ini is in the Initialization file: box as shown below:
- 5) If you click on the Edit icon, TracePort.ini will be opened with the other source files. You can then view and edit it.
- 6) Leave this window open for the next page.

**TIP:** This ini file will be executed every time you enter Debug mode. In the case of this .ini file, a  $\mu$ Vision RESET will run it again because of the function OnResetExec. See <u>www.keil.com/support/man/docs/uv4/uv4 db trace init.htm</u> for more information.

	x
Linker Debug Utilities	_
♥ Use: ULINK Pro Cortex Debugger ▼ Settings	
Load Application at Startup Run to main() Initialization File:	
.\TracePort.ini Edit	
Restore Debug Session Settinge	

**TIP:** If you are adapting this lab for other Kinetis boards, you may have to configure µVision for operation with a ULINK*pro*. See <u>www.keil.com/support/man/docs/ulinkpro/ulinkpro\_ctx\_trace.htm</u>

The next page describes how to configure ETM.

#### Configuring ETM Trace (and SWV using the 4 bit Trace port):

- 1) These instructions assume you are continuing from the previous page.
- 2) In the Options for Target window left open from the previous page, click on Settings: on the right side.
- 3) Click on the Trace tab. The window below is displayed.
- 4) Core Clock: ULINK*pro* does not strictly need this accurately set as the ULINK2 and J-Link do. μVision uses this to display timing values so it is still a good idea to insert the correct clock speed of 41.94 MHz.
- 5) In Trace Port, select Sync Trace Port with 4-bit data. It is best to use the widest size which is 4 bits.
- 6) Select CLK: 0.0 ns clock delay. D0 through D3 should be set to 2.9 ns as shown below: **Note:** not all Kinetis processors need these delay times. See specific examples for your processor. If ETM doesn't work try 0 or 4.9 ns.
- 7) Select Trace Enable and ETM Trace Enable. This enables SWV and ETM instruction traces respectively.
- 8) Select EXCTRC and leave everything else at default as shown below. Only ITM 31 and 0 need to be selected. The other ITM ports are not used and are Don't Care.
- 9) Click on OK twice to return to the main µVision menu. ETM and SWV are now configured through the Trace Port.
- 10) Select File/Save All.

Cortex-M Target Driver Setup	×

**TIP:** We said previously that you must use SWD (also called SW) in order to use the Serial Wire Viewer. With the ULINK*pro* and with the Trace Port selected, you can select the JTAG port as well as the SWD port.

ULINK*pro* can send the SWV signals out the 4 bit Trace Port which does not share any pins with JTAG. SWO shares the JTAG signal TDIO hence the conflict.

Be aware these pins are usually multiplexed with GPIO pins or other peripherals. You should make appropriate allowances for the use of these shared ports during debugging with ETM trace.

It is good engineering practice during system design to not use those pins shared with ETM for important purposes that will preclude normal operation with ETM enabled.

Trace Port options for use with ULINKpro:

Serial Wire Output - Manchester: output SWV out SWO pin. No ETM.

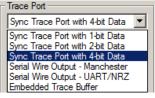

Sync Trace Port with 4 bit data: ETM out Trace Port pins. Up to 4 bits.

**Embedded Trace Buffer: (ETB) :** a small RAM inside the Kinetis used as a trace memory. Limited frame capture capability. ETB runs at full CPU speed.

Serial Wire Output – UART/NRZ: only for ULINK2 and J-Link. This selection will error if used with ULINKpro.

P&E does not support any of these settings. ULINK2 and J-Link support only Serial Wire Output – UART/NRZ.

A ULINKpro is an excellent investment providing good returns.

### 2) Blinky Example: ETM Frames starting at RESET and beyond:

The project in C:\Keil\ARM\Boards\Freescale\TWR-K60D100M\RTX\_Blinky has now been configured on the previous page to provide ETM Trace and all the features it provides using a ULINKpro.

- Compile the Blinky source files by clicking on the Rebuild icon. 1.
- Enter Debug mode. Select OK if the Evaluation Mode box appears. 2.
- DO NOT CLICK ON RUN YET !!! If you did, simply exit and re-enter Debug mode. 3.
- Open the Trace Data window by clicking on the small arrow beside the Trace icon as shown here: 4.
- Right click anywhere in the Trace Data window and select Show Functions. Size this window. 5.
- Examine the Trace Data window as shown below: This is a complete record of all the program flow since RESET 6 until µVision halted the program at the start of main() since Run To main is selected in µVision.
- In this case, Time 119 790 shows the last instruction to be executed. (BX lr). This is the jump to main(). 7.
- 8. The last two entries are an Exception entry (SVCall) and a Exception Return. The red D indicates a trace overflow.

BL.W SystemCoreClockUpdate (0x0000...

Copyright © 2016 ARM Ltd. ARM Limited or its affiliates. All rights reserved.

www.keil.com/NXP

Click on Single Step once.

- 10. The instruction BL.W will display at 0x0000 077E:
- 11. Scroll to the top of the Trace Data window to the first frame. This is the first instruction executed after the initial RESET sequence. In this case it is a LDR instruction in the RESET Handler function as shown below:
- 12. If you use the Memory window to look at location 0x4, you will find the address of the first instruction there and this will match with that displayed in frame # 1. In my case it is  $0x0000\ 08B5 + 1 = 0x08B4$  (+1 says it is a Thumb instruction). These first instructions after RESET are shown below: Note the source information that is displayed including which function and instruction belongs to. The first occurrence in a function is highlighted in orange to make the start of functions easier to find.
- 13. If you double-click on any line, this will be highlighted in both the Disassembly and relevant source windows.

	X . 0.000008EC	CTD11 -0.1-1.#0-0E1		Custom Init

**TIP:** If you unselect Run to main() in the Debug tab, no instructions will be executed when you enter Debug mode. The PC will equal 0x08B4. You can run or single-step from that point and this will be recorded in the Trace Data window.

#### ETM trace provides a powerful tool for finding nasty bugs not easily found any other way. See page 33 for a list.

• Þ

#### NXP Kinetis Cortex-M4 Lab with ARM<sup>®</sup> Keil™ MDK toolkit

### 3) Finding the Trace Frames you are looking for:

Capturing all the instructions executed is possible with ULINK*pro* but this might not be practical. It is not easy sorting through millions and billions of trace frames or records looking for the ones you want. You can use Find, Trace Triggering, Post Filtering or save everything to a file and search with a different application program such as a spreadsheet.

All

Insert Tracepoint at '0x0000027E'.

Copyright © 2016 ARM Ltd. ARM Limited or its affiliates. All rights reserved.

www.keil.com/NXP

Enable/Disable Tracepoint

Inline Assembly...

in

#### **Trace Filters:**

In the Trace Data window you can select various types of frames to be displayed. Open the Display: box and you can see the various options available as shown here: These filters are post collection. Future enhancements to  $\mu$ Vision will allow more precise filters to be selected.

#### Find a Trace Record:

In the Find a Trace Record box enter bx as shown here:

You can select properties where you want to search in the "in" box. "All" is shown in the screen above:

bx

Select the Find a Trace Record icon and the Find Trace window screen opens as shown here: Click on Find Next and each time it will step through the Trace records highlighting each occurrence of the instruction bx.

**TIP:** Or you can press Enter to go to the next occurrence of the search term.

#### **Trace Triggering:**

µVision has three trace triggers currently implemented:

- 1. **TraceRun:** Starts ETM trace collection when encountered.
- 2. **TraceSuspend:** Stops ETM trace collection when encountered. TraceRun has to have first been set and encountered to start the trace collection for this trigger to have an effect.
- 3. **TraceHalt:** Stops ETM trace, SWV and ITM. Trace collection can be resumed only with a STOP/RUN sequence. TraceStart will not restart it.

They are selected from the menu shown here: This menu is accesses by right-clicking on a valid line.

**TIP:** These trace commands have no effect on SWV or ITM. TraceRUN starts the ETM trace and TraceSuspend and TraceHalt stops it.

#### How it works:

When you set a TraceRun point in assembly language point, ULINK*pro* will start collecting trace records. When you set a TraceSuspend point, trace records collection will stop there. EVERYTHING in between these two times will be collected. This includes all instructions through any branches, exceptions and interrupts.

Sometimes there is some skid past the trigger point which is a normal operation.

### **Trace Commands:**

There are a series of Trace Commands you can enter in the Command window while in Debug mode.

See <a href="www.keil.com/support/man/docs/uv4/uv4\_debug\_commands.htm">www.keil.com/support/man/docs/uv4/uv4\_debug\_commands.htm</a>

TL - Trace List: list all tracepoints.

TK - Trace Kill: tk\* kills all tracepoints or tk number only a specified one i.e. tk 2.

TIP: TK\* is very useful for deleting tracepoints when you can't find them in the source or Disassembly windows.

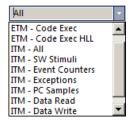

TL is useful for finding any tracepoints set. Results are displayed in the Command window.

In Column: All
)

TraceRun (ETM)

TraceHalt

TraceSuspend (ETM)

×

### 4) How to Set Trace Triggers:

- 1. Stop the program  $\bigotimes$  and stay in Debug mode.
- 2. In Blinky.c, click inside the function LED\_Off near line 60 or 61 to highlight the code in the Disassembly window.
- 3. Right-click on LDR at 0x654 in the Disassembly window (just after line 62). (your addresses might be different)
- 4. Select Insert Tracepoint at 0x0654 and select TraceRun (ETM). A cyan T will appear as shown below:
- 5. Right-click on LDR in left margin at 0x065A as shown below in the Disassembly window:
- Select Insert Tracepoint at 0x065A and select TraceSuspend (ETM). A cyan T will appear.
- Clear the Trace Data window for convenience. This is an optional step.
- 8. Click RUN and after a few seconds click STOP.
- 9. Filter exceptions out by selecting ETM Code Exec in the Display in the Trace Data window: Display: ETM - Code Exec
- 10. Examine the Trace Data window as shown below:

You can see below where the trace started on 0x654 and stopped on 0x65A:

All other frames are discarded.

- 11. In the Command window, enter TL and press Enter. The two Trace points are displayed.
- **12.** Enter TK\* and press Enter to delete all Tracepoints.

#### **Trace Skid:**

The trace triggers use the same CoreSight hardware as the Watchpoints. This means that it is possible a program counter skid might happen. The program might not start or stop on the exact location you set the trigger to.

You might have to adjust the trigger point location to minimize this effect.

This is because of the nature of the comparators in the CoreSight module and is normal behavior.

### 5) Code Coverage:

- 1. Click on the RUN icon. 💷 After a second or so stop the program with the STOP icon.
- 2. Examine the Disassembly and Blinky.c windows. Scroll and notice different color blocks in the left margin:
- 3. This is Code Coverage provided by ETM trace. This indicates if an instruction has been executed or not.

Colour blocks indicate which assembly instructions have been executed.

- 1. Green: this assembly instruction was executed.
  - 2. Gray: this assembly instruction was not executed.
  - 3. Orange: a Branch is never taken.
  - 4. Cyan: a Branch is always taken.
  - 5. Light Gray: there is no assembly instruction here.
  - 6. RED: Breakpoint is set here. (is actually a circle)
  - 7. The next instruction to be executed.

Disassembly	😃 Instruction T	race		

In the window on the right you can easily see examples of each type of

Code Coverage block and if they were executed or not and if branches were taken (or not).

**TIP:** Code Coverage is visible in both the Disassembly and source code windows. Click on a line in one and this place will be matched in the other.

In the window above, why was 0x0000\_0ACA never executed ? You should devise tests to execute instructions that have not been executed. What will happen to your program if this untested instruction is unexpectedly executed ?

Code Coverage tells what assembly instructions were executed. It is important to ensure all assembly code produced by the compiler is executed and tested. You do not want a bug or an unplanned circumstance to cause a sequence of untested instructions to be executed. The result could be catastrophic as unexecuted instructions have not been tested. Some agencies such as the US FDA require Code Coverage for certification. This is provided in MDK µVision using ULINK*pro*.

Good programming practice requires that these unexecuted instructions be identified and tested.

Code Coverage is captured by the ETM. Code Coverage is also available in the Keil Simulator.

A Code Coverage window is available as shown below. This window is available in View/Analysis/Code Coverage. The next page describes how you can save Code Coverage information to a file.

### 6) Saving Code Coverage information:

Code Coverage information is temporarily saved during a run and is displayed in various windows as already shown. It is possible to save this information in an ASCII file for use in other programs.

**TIP:** To get help on Code Coverage, type Coverage in the Command window and press the F1 key.

You can Save Code Coverage in two formats:

- 1. In a binary file that can be later loaded back into µVision. Use the command Coverage Save *filename*.
- 2. In an ASCII file. You can either copy and paste from the Command window or use the log command:
  - 1)  $\log > c: c: test.txt$ ; send CC data to this file. The specified directory must exist.
  - 2) coverage asm ; you can also specify a module or function.
  - 3) log off ; turn the log function off.

1) Here is a partial display using the command coverage. This displays and optionally saves everything.

```
\\Blinky\Blinky.c\SysTick_Handler - 100% (6 of 6 instructions executed)
\\Blinky\Blinky.c\main - 92% (89 of 96 instructions executed)
3 condjump(s) or IT-bcock(s) not fully executed
\\Blinky\Blinky.c\Delay - 100% (9 of 9 instructions executed)
\\Blinky\system_MK60N512MD100.c\SystemInit - 100% (34 of 34 instructions executed)
2 condjump(s) or IT-bcock(s) not fully executed
\\Blinky\system_MK60N512MD100.c\SystemCoreClockUpdate - 31% (36 of 116 instructions executed)
5 condjump(s) or IT-bcock(s) not fully executed
\\Blinky\startup_MK60N512MD100.s\_asm_0x27C - 47% (9 of 19 instructions executed)
\\Blinky\startup_MK60N512MD100.s\Reset_Handler - 100% (4 of 4 instructions executed)
\\Blinky\startup_MK60N512MD100.s\NMI_Handler - 0% (0 of 1 instructions executed)
\\Blinky\startup_MK60N512MD100.s\HardFault_Handler - 0% (0 of 1 instructions executed)
\\Blinky\startup_MK60N512MD100.s\MemManage_Handler - 0% (0 of 1 instructions executed)
```

#### 2) The command coverage asm produces this listing (partial is shown):

\\Blinky\Blinky.c\SysTick_Handler - 100% (6 of 6 instructions executed)	
EX   0x000002B8 SysTick_Handler:	
EX   0x000002B8 483D LDR r0,[pc,#244] ; @0x000003B0	
EX   0x000002BA 6800 LDR r0,[r0,#0x00]	
EX   0x000002BC 1C40 ADDS r0,r0,#1	
\\Blinky\Blinky.c\main - 92% (89 of 96 instructions executed)	
3 condjump(s) or IT-bcock(s) not fully executed	
EX   0x000002C4 main:	
EX   0x000002C4 F04F34FF MOV r4,#0xFFFFFFFF	
EX   0x000002C8 2501 MOVS r5,#0x01	
EX   0x000002CA F000F8CB BL.W SystemCoreClockUpdate (0x00000464)	

The first column above describes the execution as follows:

- **FT** Branch is fully taken
- **NT** Branch is not taken
- AT Branch is always taken.
- **EX** Instruction was executed (at least once)

 Shown here is an example using: coverage \Blinky\main details

If the log command is run, this will be saved/appended to the specified file.

You can enter the command coverage with various options to see what is displayed.

### 7) Performance Analysis (PA):

Performance Analysis tells you how much time was spent in each function. It is useful to optimize your code for speed.

Keil provides Performance Analysis with the  $\mu$ Vision simulator or with ETM and the ULINK*pro*. The number of total calls made as well as the total time spent in each function is displayed. A graphical display is generated for a quick reference. If you are optimizing for speed, work first on those functions taking the longest time to execute.

- 1. Use the same setup as used with Code Coverage.
- 2. Select View/Analysis Windows/Performance Analysis. A window similar to the one below will open up.
- Exit Debug mode and re-enter it. Q This clears the PA window and resets the Kinetis processor and reruns to main(). You might have to cycle the power to the ULINK*pro* and the TWR board to get this exact window below. This will remove any artifacts left over. Close and restart μVision if necessary.
- 4. Do *not* click on RUN yet Expand some of the module names as shown below.

Performance Analyzer				ф ;
Reset Show: Modules	•			
Module/Function	Calls	Time(Sec)	Time(%)	4
⊡ RTX_Blinky		189.318 us	100%	
SVC_Table.s		Ous	0%	
HAL_CM3.c		3.004 us	2%	
/rt_Robin.c		0.381 us	0%	
		13.829 us	7%	
		1.812 us	1%	-
		4.840 us	3%	
		Ous	0%	
		Ous	0%	
		1.383 us	1%	
		5.579 us	3%	

- 5. Shown is the number of calls and percentage of total time in this short run from RESET to the beginning of main().
- 6. Click on the RUN icon. See the PA window below:
- 7. Note the display changes in real-time while the program Blinky is running. There is no need to stop the processor to collect the information. No code stubs are needed in your source files. Most time is spent in the Delay function.
- 8. Select Functions from the pull down box as shown here and notice the difference.
- 9. Exit and re-enter Debug mode again and click on RUN. Note the different data set displayed.

Functions	-
Functions Modules	

**TIP:** You can also click on the RESET icon but the processor will stay at the initial PC and will not run to main(). You can type **g**, **main** in the Command window to accomplish this.

- 10. Click on the PA RESET icon. Reset Watch as new data is displayed in the PA window.
- 11. When you are done, STOP  $\bigotimes$  and exit Debug mode  $\bigotimes$ .

TIP: The Performance Analyzer uses ETM to collect its raw data.

### 8) Execution Profiling:

Execution profiling is used to display how much time a C source line took to execute and how many times it was called. This information is provided by the ETM trace in real time while the program keeps running. The µVision simulator also provides Execution Profiling.

Execution Profiling

- 1. Enter Debug mode.
- 2. Select Debug/Execution Profiling/Show Time.
- 3. Click on RUN.
- 4. In the left margin of the disassembly and C source windows will display various time values.
- 5. The times will start to fill up as shown below:
- 6. Click inside the yellow margin of Blinky.c to refresh it.
- 7. This is done in real-time and without stealing CPU cycles.
- 8. Hover the cursor over a time and ands more information appears as in the yellow box here:

Time:	Calls:	Average:
19.599 s	139910257 *	0.140 µs

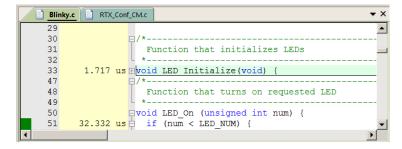

9. Recall you can also select Show Calls and this information rather than the execution times will be displayed in the left margin.

		system_MK60N512M	D100.c 🔝 startup_MK60N512MD100.s 🔛 Blinky.c 🖬 Abstract.txt 🔹 🗙
	82		LED_Config();
	83		
	84	E	while(1) {
	85		<pre>/* Calculate 'num': 0,1,,LED_NUM-1,LED_NUM-1,,1,0,0,</pre>
	86	28.488 us	num += dir;
	87	62.171 us	<pre>if (num == LED_NUM) { dir = -1; num = LED_NUM-1; }</pre>
	88	47.367 us	else if (num < 0) { dir = 1; num = 0; }
	89		
	90	138.790 us	LED_On (num);
	91	46.263 us	Delay(250);
	92	137.153 us	LED_Off(num);
	93	45.694 us	Delay(250);
	94		Time: Calls: Average:
	95		45.730 us 1289 * 0.035 us
	96		}
I			

### **Outlining:**

Each place there is a small square with a "-" sign 📮 can be collapsed down to compress the associated source files together.

- 1) Click in the square near the while(1) loop near line 33 as shown here:
- The C source in the function LED\_Initialize is now collapsed into one line. 2)
- The times are added together to 1.717 usec 3) in this case:
- 4) This can be useful to hide sections of code to simplify the window you are reading.
- 5) Click on the + to expand it.
- Stop the program 🥸 6)
- Exit Debug mode 🖳 7)

Disabled

### 9) In-the-Weeds Example: (your addresses might not be the same as shown here)

Some of the hardest problems to solve are those when a crash has occurred and you have no clue what caused this – you only know that it happened and the stack is corrupted or provides no useful clues. Modern programs tend to be asynchronous with interrupts and RTOS task switching plus unexpected and spurious events. Having a recording of the program flow is useful especially when a problem occurs and the consequences are not immediately visible. Another problem is detecting race conditions and determining how to fix them. ETM trace handles these problems and others easily and it is not hard to use.

If a Bus Fault occurs in our example, the CPU will end up at 0x08BE as shown in the Disassembly window below. This is the Bus Fault handler. This is a branch to itself and will run this instruction forever. The trace buffer will save millions of the same branch instructions. This is not very useful.

This exception vector is found in the file startup\_MK60D10.s. If we set a breakpoint by clicking on the Hard Fault Handler and run the program: at the next Bus Fault event the CPU will again jump to the HardFault\_Handler.

The difference this time is the breakpoint will stop the CPU and also the trace collection. The trace buffer will be visible and useful to investigate and determine the cause of the crash.

492:	PROC		
493:	EXPORT	MemManage Handle	r [WEAK]
0x000008BE E7FE	в н	ardFault Handler	(0x000008BE)

495:	ENDP		
496: BusFault	Handler\		
497.	PROC		
			<u>•</u>
Disassembly 🔚 Perform	ance Analyzer   CODE Co	de Coverage	

- 1. Use the RTX\_Blinky example from the previous exercise, enter Debug mode.
- 2. Locate the Hard Fault near address 0x08BE in the Disassembly window or near line 489 in startup\_MK60D10.s.
- 3. Set a breakpoint at this point. A red circle will appear. You can do this in Edit or Debug mode in the .s file.
- 4. In the Command window enter: **g**, **LED\_On** and press ENTER. This will put the PC at the start of this function. LED\_On returns with a BX lr; near address 0x64E which we will use to create a Hard Fault by using lr = 0.
- 5. The assembly and sources in the Disassembly window do not always match up and this is caused by anomalies in ELF/DWARF specification. In general, scroll downwards in this window to provide the best match.
- 6. Clear the Trace data window by clicking on the Clear Trace icon: 🕅 This is to help clarify what is happening.
- 7. In the Register window, double-click on R14 (LR) register and set it to zero. This is guaranteed to cause a Hard Fault when the processor tries to execute an instruction at 0x2001 10F8. This is the initial SP address.
- 8. Click on RUN and almost immediately the program will stop on the Hard Fault exception branch instruction.
- 9. In the Trace Data window you will find the LED\_On function with the BX LR at the end. This is what caused the Hard Fault since you set lr = 0. When the function tried to return, the bogus value of lr caused a Hard Fault.
- 10. The B instruction at the Hard Fault vector was not executed because ARM CoreSight hardware breakpoints do not execute the instruction they are set to when they stop the program. They are no-skid breakpoints.
- 11. Click on Single Step. You will now see the Hard Fault branch as shown in the bottom screen:

This example clearly shows how quickly ETM trace can help debug program flow bugs.

**Exception Entry:** Note at the top the Hard fault exception is listed. How can this happen before the Hard Fault happens ? This entry is part of SWV – the timestamps are different for SWV and ETM instructions so they can be out of sync. Use Display: to filter out such events.

**TIP:** Instead of setting a breakpoint on the Hard Fault vector, you could also right-click on it and select Insert Tracepoint at line 489... and select TraceHalt. When Hard Fault is reached is reached, trace collection will halt but the program will keep executing forever.

12. Exit Debug mode. 🖳

### **10)** Serial Wire and ETM Trace Summary:

We have several basic debug systems implemented in Kinetis Cortex-M4 devices:

- 1. SWV and ITM data output on the SWO pin located on the JTAG/SWD 10 pin CoreSight debug connector. The 20 pin connector adds ETM trace.
- 2. ITM is a printf type viewer. ASCII characters are displayed in the Debug printf Viewer in µVision.
- 3. Non-intrusive Memory Reads and Writes in/out the JTAG/SWD ports (DAP).
- 4. Breakpoints and Watchpoints are set/unset through the JTAG/SWD ports.
- 5. ETM provides a record of all instructions executed. ETM also provides Code Coverage and Performance Analysis.

These features are completely controlled through µVision via a ULINK.

### These are the types of problems that can be found with a quality ETM trace:

SWV Trace adds significant power to debugging efforts. Problems which may take hours, days or even weeks in big projects can often be found in a fraction of these times with a trace. Especially useful is where the bug occurs a long time before the consequences are seen or where the state of the system disappears with a change in scope(s) or RTOS thread switches.

Usually, these techniques allow finding bugs without stopping the program. These are the types of problems that can be found with a quality trace: Some of these items need ETM trace.

- 1) Pointer problems.
- 2) Illegal instructions and data aborts (such as misaligned writes). How I did I get to this Fault vector ?
- 3) Code overwrites writes to Flash, unexpected writes to peripheral registers (SFRs). How did I get here ?
- 4) A corrupted stack.
- 5) Out of bounds data. Uninitialized variables and arrays.
- 6) Stack overflows. What causes the stack to grow bigger than it should ?
- 7) **Runaway programs:** your program has gone off into the weeds and you need to know what instruction caused this. *This is probably the most important use of trace.*
- 8) Communication protocol and timing issues. System timing problems.
- 9) Trace adds significant power to debugging efforts. Tells you where the program has been.
- 10) Weeks or months can be replaced by minutes.
- 11) Especially where the bug occurs a long time before any consequences are seen.
- 12) Or where the state of the system disappears with a change in scope(s).
- 13) Plus don't have to stop the program to test conditions. Crucial to some applications.
- 14) A recorded history of the program execution in the order it happened. Source and Disassembly is as it was written.
- 15) Trace can often find nasty problems very quickly.
- 16) Profile Analysis and Code Coverage is provided. Available only with ETM trace.

### What kind of data can the Serial Wire Viewer display ?

- 1. Global variables.
- 2. Static variables.
- 3. Structures.
- 4. Can see Peripheral registers just read or write to them. The same is true for memory locations.
- 5. Can see executed instructions. SWV only samples them. Use ETM to capture all instructions executed.
- 6. CPU counters. Folded instructions, extra cycles and interrupt overhead.

### What Kind of Data the Serial Wire Viewer can't display...

- 1. Can't see local variables. (just make them global or static).
- 2. Can't see register operations. PC Samples records some of the instructions but not the data values.
- 3. SWV can't see DMA transfers. This is because by definition these transfers bypass the CPU. SWV and ETM can only see CPU actions. If using a ULINK*pro* and RTX, DMA exceptions will display in the Event Viewer.

### Part E:

### 1) Creating your own MDK 5 project from scratch:

All examples provided by Keil are pre-configured. All you have to do is compile them. You can use them as a starting point for your own projects. However, we will start this example project from the beginning to illustrate how easy this process is. Once you have the new project configured; you can build, load and run a bare metal (no OS) Blinky example. It will have a simple incrementing counter to monitor. However, the processor startup sequences are present and you can easily add your own source code and/or files. You can use this process to create any new project, including one using an RTOS.

#### Install the Software Pack for your processor:

- 1. Start µVision and leave it in Edit mode. Do not enter Debug mode. A project must be loaded. Any project at all.
- 2. Pack Installer: The Keil::Kinetis\_K60\_DFP Software Pack must be installed. This was done on page 4.

#### Create a new Directory and a New Project:

- In the main μVision menu, select Project/New μVision Project... Create New Project window opens:
- 4. In this window, shown here, navigate to the folder C:\00MDK\Boards\Freescale\TWR-K60D100M\
- 5. Right click in this window and select New and create a new folder. I called it BlinkyNEW.
- 6. Double click on BlinkyNew to open it or highlight it and select Open.
- 7. In the File name: box, enter Blinky. Click on Save.
- 8. This creates the project Blinky.uvproj. (MDK 4 format)
- 9. The Select Device for Target...opens:

#### Select the Device you are using:

1. Expand NXP and then select MK60DN512xx10 as shown here:

TIP: Make sure you select the deepest layer device or this will not work correctly.

2. Click OK and the Manage Run Time window shown below right opens.

#### Select the CMSIS components you want:

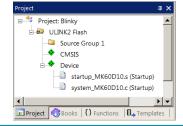

- 1. Expand CMSIS and Device. Select CORE and Startup as shown below. They will be highlighted in Green indicating there are no other files needed. Click OK to close.
- 2. Click on File/Save All or select the Save All icon:
- 3. The project Blinky.uvproj will now be changed to Blinky.uvprojx. (MDK 4  $\implies$  MDK 5 format)
- 4. You now have a new project list as shown on the bottom left below: The CMSIS files you selected have been automatically entered and configured into your project for your selected processor.
- 5. Note the Target Selector says Target 1. Highlight Target 1 in the Project window.
- 6. Click once on it and change its name to ULINK2 Flash and press Enter. The Select Target name will also change.

🐺 Manage Run-Time Environment

#### What has happened to this point:

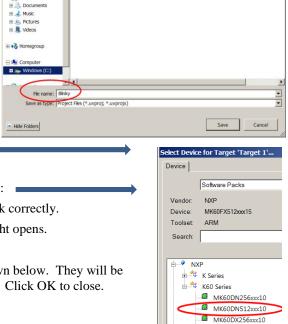

You have created a blank  $\mu$ Vision project using MDK 5 Software Packs. All you need to do now is add your own source files and select your debug adapter. The Software Pack has pre-configured many settings for your

convenience.

Software Component	Sel.	Variant	Version	Description
E 🔶 CMSIS				Cortex Microcontroller Software Interface Compone
CORE	•	$\supset$	4.3.0	CMSIS-CORE for Cortex-M, SC000, and SC300

CMSIS RTX

#### Create a blank C Source File:

- 1. Right click on Source Group 1 in the Project window and select
- 2. This window opens up:
- 3. Highlight the upper left icon: C file (.c):
- 4. In the Name: field, enter Blinky.
- Click on Add to close this window. 5.
- Click on File/Save All or 6.
- 7. Expand Source Group 1 in the Project window and Blinky.c will now display. It is a blank file.

#### Add Some Code to Blinky.c:

5.

- Right click in Blinky.c and select Insert '#include file'. 1.
- Select MK60D10.h. This will be added to Blinky.c 2.
- In the blank Blinky.c, add the C code below: 3.
- Click on File/Save All or 4.

Build the files.	There will be no errors or warnings if all was entered correctly.
------------------	---

<pre>#include "MK60D10.h" //Device Header</pre>
unsigned int counter = 0;
/*
MAIN function
**/
int main (void) {
while(1) {
counter++;
if (counter > 0x0F) counter = 0;
} } //make sure you add a CR Carriage Return or Enter after the last parentheses.

**TIP:** You can also add existing source files:

#### Configure the Target Flash: Please complete these instructions carefully to prevent unusual problems...

1. Select the Target Options icon 🔊. Select the **Target** tab. Note the Flash and RAM addresses are already entered.

Add Existing Files to Group 'Source Files'.

- Select Use MicroLIB to optimize for smaller code size. An error will be generated if you cannot use this feature. 2.
- 3. Select the Linker tab. Select Use Memory Layout from Target Dialog.
- Use: ULINK2/ME Cortex Debugger 4. Click on the **Debug** tab. Select the debugger you are using in the Use: box: You can use a P&E, ULINK2, ULINKpro or a J-Link. It is possible to use a CMSIS-DAP compliant adapter.
- Connect your NXP TWR to your PC USB port. If using an external adapter such as a ULINK2, connect it now. 5.
- Select Settings: box beside Use ULINK2/ME Debugger as shown above. 6.
- Set SW and SWJ as shown here: Find the form of the set 7. valid IDCODE and Device Name in the SW Device box. If you do not, you must correct this before continuing.
- Click on the Flash Download tab. Confirm the correct Flash algorithms are present: Shown here are the correct 8. ones for the K60D100M TWR board:
- 9. Click on OK twice to return to the main menu.
- 10. Click on File/Save All or

Flogramming Algonium

Debug Utilities

Settings

11. Build the files. There will be no errors or warnings if all was entered correctly. If there are, please fix them !

The Next Step ? First we will do a summary of what we have done so far and then ....

Let us run your program and see what happens ! Please turn the page....

Text File (.bd)	nplate					
Туре: С	CFile (.c)					
Name:	llinky					
Location:	:\00MDK\Boards	\Freescale\TWR-K60D1	L00M\Blink	y_New		
		Add		Close		Help

Add New Item to Group 'Source Files'

Add New Item to G C C File (.c)

C++ File (.cpp)

A Asm File (.s) h Header File (.h)

#### What we have so far ?

- A project has been created in C:\00MDK\Boards\Freescale\TWR-K60D100M\\BlinkyNEW\ 1.
- 2. The folders have been created as shown here:
- RTE contains the CMSIS-Core startup and system files. 3.
- The Software Pack has pre-configured many items in this new project for your convenience. 4.

#### **Running Your Program:**

- 1. Enter Debug mode by clicking on the Debug icon . The Flash will be programmed.
- Click on the RUN icon. 💷 Note: you stop the program with the STOP icon. 🤒 2.
- Right click on counter in Blinky.c and select Add 'counter' to ... and select Watch 1. 3.
- counter should be updating as shown here: 4.
- You can also set a breakpoint in Blinky.c and the program should stop at 5. this point if it is running properly. If you do this, remove the breakpoint.
- 6. You are now able to add your own source code to create a meaningful project. You can select software components in the Manage Run-time Environment window. You can experiment with this later.

**TIP:** Watch 1 is updated periodically, not when a variable value changes. Since Blinky is running very fast without any time delays inserted, the values in Watch 1 will appear to jump and skip some sequential values that you know must exist.

#### **Configuring the CPU Clock:**

The file system\_MK60D10.c contains the CPU clock setup code. This project is running at the default of 41.94 MHz.

- 7. In Blinky.c, near line 7, just after int main(void) {, add this line:
- Click on File/Save All or 8.
- Build the files. There will be no errors or warnings. 9.
- 10. Enter Debug mode. 4 The Flash will be programmed.
- 11. In Watch 1, double click on <Enter expression> and enter SystemCoreClock and press Enter.
- 12. Right click on SystemCoreClock in Watch1 and unselect Hexadecimal Display.
- 13. The CPU speed is displayed as 41.94 MHz as shown in the global variable SystemCoreClock in Watch 1.
- 14. Click on the RUN icon.
- 15. Stop the CPU. 🤒 and exit Debug mode.

#### What else can we do ?

- 5. You can create new source files using the Add New Item window. See the top of the previous page.
- You can add existing source files by right clicking on a Group name and selecting Add Existing Files. 6.
- You can easily add NXP example files to your project. You can use Professor Expert to help you. 7.
- If you use RTX or Keil Middleware, source and template files are provided in the Add New window. 8.
- Now, we will add RTX to your new project ! 9.

温 RTE 📄 Blinky.c

### 2) Adding RTX to your MDK 5 project:

Software Packs contain the code needed to add RTX to your project. RTX is CMSIS-RTOS compliant. Configuring RTX is easy in MDK 5. These steps use the preceding Blinky example you constructed.

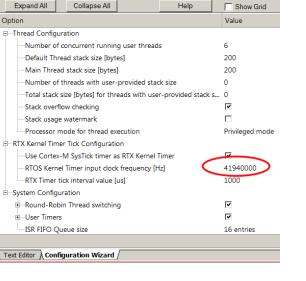

- 1. Using the same example from the preceding pages, Stop the program 🎱 and Exit Debug mode.
- Open the Manage Run-Time Environment window: 🕸 2.
- 3. Expand all the elements as shown here:
- Select Keil RTX as shown and click OK. 4.
- 5. Appropriate RTX files will be added to your project. See the Project window.
- In Blinky.c, on the first line, right click and select Insert '# include file'. Select 6. "cmsis\_os.h". This will be added as the first line in Blinky.c.

#### **Configure RTX:**

- 1. In the Project window, expand the CMSIS group.
- Double click on RTX\_Conf\_CM.c to open it. 2.
- 3. Select the Configuration Wizard tab at the bottom of this window: Select Expand All.
- The window is displayed here: 4.
- 5. Select Use Cortex-M SysTick Timer as RTX Kernel Timer.
- 6. Set Timer clock value: to 41940000 as shown: (41.94 MHz)
- 7. Use the defaults for the other settings.

#### **Build and Run Your RTX Program:**

- Click on File/Save All or 1.
- Build the files. There will be no errors or warnings. 2.
- Enter Debug mode: Q Click on the RUN icon. 3.
- Select Debug/OS Support/System and Thread Viewer. The 4. window below opens up.
- You can see three threads: the main thread is the only one 5. running. As you add more threads to create a real RTX program, these will automatically be added to this window.
- 6. Stop the program 🥙 and Exit Debug mode. 🔍

#### What you have to do now:

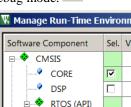

- 1. You must add the RTX framework into your code and create your threads to make this into a real RTX project.
- 2. Getting Started MDK 5: Obtain this useful book here: www.keil.com/gsg/. It has information on implementing RTX as well as other subjects.
- You can use the Event Viewer to 3. examine your threads graphically if you have a ULINK2, ULINKpro or a J-Link. Event Viewer uses SWV which is not yet supported by P&E.

Property	Valu	e						
System	Item			Value				
	Tick 1	limer:		1.000 mSec				
	Rour	nd Robin Timeout:		5.000 mSec				
	Defa	ult Thread Stack Size:		200				
	Threa	ad Stack Overflow Check	k:	Yes				
	Threa	ad Usage:		Available: 7, Used	l: 3 + o			
Threads	ID	Name		State	Delay	Event Value	Event Mask	Stack Usage
	1	osTimerThread	High	Wait_MBX				36%
	2	main	Normal	Running				0%
	255	os idle demon	None	Ready				

Blinky.c RTX\_Conf\_CM.c

#### TIP: The Configuration Wizard is a scripting

language as shown in the Text Editor as comments starting such as a </h> or <i>. See www.keil.com/support/docs/2735.htm for instructions on how to add this feature to your own source code.

Keil RTX

Show Grid

### 3) Adding a Thread to your RTX\_Blinky:

We will create and activate a thread. We will add an additional variable counter2 that will be incremented by this new thread. 4 unsigned int counter2 = 0;

1. In Blinky.c, add this line near line 5: unsigned int counter2 = 0;

#### Create the Thread job1:

 Add this code before main(): This will be the new thread named job1.

osDelay(500) delays the program by 500 clock ticks to slow it down so we can easier see the values of counter and counter2 increment by 1.

#### Add osDelay to main():

3. Add this line just after the if statement near line 20:

#### **Define and Create the Thread:**

- 1. Add this line near line 15 just before main():
- 2. Create the thread job1 near line 18 just after main() and before the while(1) loop:
- 3. Click on File/Save All or
- 4. Build the files. There will be no errors or warnings. If there are, please fix them before continuing.
- 5. Enter Debug mode: Q Click on the RUN icon.
- 6. Right click on counter2 in Blinky.c and select Add counter2 to ... and select Watch 1.
- Both counter and counter2 will increment but slower than before: The two osDelay(500) function calls each slow the program down by 500 msec. This makes it easier to watch these two global variables increment.

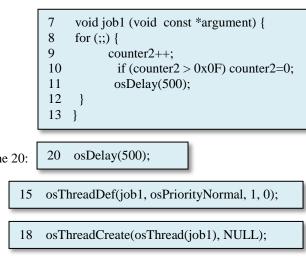

**TIP:** osDelay() is a function provided by RTX and is triggered by the SysTick timer.

- 8. Open the System and Thread Viewer by selecting Debug/OS Support.
- 9. Note that job1 has now been added as a thread as shown below:
- 10. Note os\_idle\_demon is always labelled as Running. This is because the program spends most of its time here.
- 11. Set a breakpoint in job1 and the program will stop there and job1 is displayed as "Running" in the Viewer.
- 12. Set another breakpoint in the while(1) loop in main() and each time you click RUN, the program will change threads.
- 13. There are many attributes of RTX you can add. RTX help files are located here depending on your CMSIS version: C:/Keil\_v5/ARM/Pack/ARM/CMSIS/*x.x.x*/CMSIS/Documentation/RTX/html/index.html.
- 14. Remove any breakpoints you have created.

	-,

### 4) Viewing RTX Thread Timing: Requires a Keil ULINK2/ME, ULINK*pro* or a Segger J-Link.

The Event Viewer displays threads running in a graphical format. It is possible to make timing measurements.

The Event Viewer uses Serial Wire Viewer (SWV). The P&E debug adapter does not support SWV. In order to do the

exercise on this page, you must use any Keil ULINK or a J-Link. A ULINK2 is better and a ULINKpro is best for SWV.

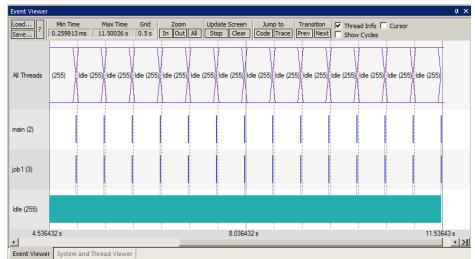

This page assumes you are running your Blinky with any ULINK or a J-Link connected to your TWR-K60D100M board.

#### **Configure SWV:**

- 1. Stop the program  $\bigotimes$  and Exit Debug mode.
- Select the Target Options icon 2.
- Click on the Debug tab. Select the debugger you are using in the Use: box: This is for ULINK2: ULINK2/ME Contex Debugger 3.
- Click on Settings on the right side of the target Options window. The Cortex-M Target Driver Setup window opens. 4.
- Set SW as shown here: Port SW I JTAG does not support SWV. If your TWR board is connected to your PC, you 5. should now see a valid IDCODE and Device Name in the SW Device box. If you do not, you must correct this before continuing.
- 6. Set Max. Clock: to 2 MHz. If this value is too high, Flash programming might not work reliably resulting in an error
- 7. Select the Trace tab. Select Core Clock: to 41.94 (41.94 MHz). Select Trace Enable.
- Unselect EXCTRC to minimize potential SWO overflows. This might not be needed. You can experiment later . 8.
- Click OK twice to close the Target configuration windows. 9.
- 10. Click on File/Save All or 🔛 SWV is now configured.

### **Run Blinky and Open Event Viewer:**

- Enter Debug mode: <sup>Q</sup> Click on the RUN icon. 1.
- 2. The program should be running as shown in the System and Thread Viewer as shown on the previous page. Viewing this window gives a good indication RTX is configured and running properly.
- Select Debug/OS Support and select Event Viewer. 3.
- 4. This window will open and if SWV is correctly configured, the threads will be visible.
- 5. Use the In and/or Out buttons to select an appropriate horizontal scale.

- The space between the same thread is 5 msec. This is 5 times the tick rate as set in the RTX config file. 6.
- Note the program spends most of its time in Idle (os demon). This can be modified in your program. 7.

#### The next section describes how to create a $\mu$ Vision project from NXP Kinetis Expert.

41

### 5) Using Kinetis Expert to create a MDK 5 Project:

Kinetis Expert is a utility provided by NXP to simplify creating and configuring Kinetis devices. A MDK 5 .uvprojx is created that can be directly loaded into  $\mu$ Vision, compiled and run. You can then add your own source code and debug it all.

. Guest

Login

#### Starting and Configuring Kinetis Expert:

- 1. The URL for Kinetis Expert is <u>http://kex.nxp.com</u>
- 2. You will need to create an account and sign in:
- 3. In the System Configuration Tool (<u>http://kex.nxp.com/en/welcome</u>): select Build an SDK:
- 4. Select the Configurations: button:
- 5. The page (<u>http://kex.nxp.com/en/configs</u>) will open. Select New Configuration:
- 6. Select the processor or board you are using: Name this configuration and click Select configuration:
- 7. In the Kinetis SDK Summary page your board or processor will be displayed.
- 8. Select SDK 2.0 (or the latest), Keil MDK and Windows as shown here:

Package name	SDK version	Supported toolcha	ain(s)	Host OS	
SDK_2.0_TWR-K60D100M	SDK 2.0 🔻	Keil MDK	•	Windows	•

9. Unselect any RTOSs selected. We do not need or want an RTOS at this time for simplicity.

#### Building and Downloading Your Kinetis MDK Project:

- 1. Select Build SDK package: You will be prompted with the progress.
- 2. When the Build is completed this icon will briefly display: Package SDK\_2.0\_TWR-K60D100M added to software vault
- 3. The Software Vault icon will indicated the number of files in it: 😳 Software Vault 1
- 4. Click the Software vault icon and download the project to your PC. It will be a .zip file.
- 5. Extract this file into a suitable folder: I used C:\00MDK\Boards\Freescale\TWR-K60D100M\KEX\ It will be in a sub-folder with the name of the SDK: In this case it is \SDK\_2.0\_TWR-K60D100M
- 6. You can explore and see the many other examples and useful code is present.
- 7. You should also explore the Pins Tool in Kinetis Expert:

#### Importing an Example into uVision:

- 1. We will use the example Bubble which uses the accelerometer to change the display of the LEDS.
- 2. In µVision, select Project/Open Project and navigate to:

 $C:\label{eq:complex} C:\label{eq:complex} C:\labe$ 

3. In the MDK folder is the project bubble.uvprojx. Highlight this and select Open. Bubble will open in  $\mu$ Vision.

#### Build and Run Bubble: (using P&E OSJTAG: See page 9 for instructions to configure this )

- 1. Build the files. If there will be no errors or warnings. If there are, please fix them before continuing.
- 2. Connect the K60 board to your PC with a USB cable. The P&E debug adapter is used by default.
- 3. Enter Debug mode: 🔍 Click on the RUN icon. 💷
- 4. The red and blue LEDs will vary brightness depending on how you move the board. Try moving it slowly.

#### Display X and Y angles using the P&E CDC COM Port:

- 5. Determine from Windows Device manager the COM port used by OSBDM/OSJTAG CDC Serial Port.
- 6. Enter this into your favourite terminal program (such as PuTTY) and set the speed to 115200 Baud.
- 7. The angle the board is positioned is displayed in degrees for both the X and Y axis:
- 8. The next page describes how to view these variables using Serial Wire Viewer:

COM44 - PuTTY

12

421

Select Configuration

Build an SDK

This is at http://kex.nxp.com/en/summary.

Pins Tool

### 6) Displaying Serial Wire Viewer Information on a Kinetis Expert Project:

A ULINK2, ULINKpro or a J-Link arte needed to display Serial Wire information. P&E do not currently support SWV. We will display the Xangle and Yangle variables in the Logic Analyzer window. First, we need to make them global. This tutorial uses a ULINK2. To use a ULINKpro or a J-Link you must configure uVision differently. Recall you must stop the program to update the Trace Records window. ULINK2 updates this window while the program runs.

#### **Connection:**

- 1. Connect a ULINK2 (or ULINKpro or a J-Link) to the K60D100M board and power both with USB cables.
- 2. If the program is running: stop it 🥙 and Exit Debug mode.

#### **Configure SWV:**

- 1. Select the Target Options icon 🔊. Select the Debug tab.
- 2. Select the debugger you are using in the Use: box: This is for ULINK2: ULINK2/ME Cortex Debugger
- 3. In the Initialization File field, remove any text that is present. If using Trace Port with a ULINK*pro* a file is needed.
- 4. Click on Settings on the right side of the target Options window. The Cortex-M Target Driver Setup window opens.
- 5. Set SWJ and SW as shown here:
- 6. If everything is working correctly, you should now see a valid IDCODE and Device Name in the SW Device box. **If you do not**, you **must** correct this before continuing.
- 7. Select the Trace tab. Select Core Clock: to 96 (96 MHz). Select Trace Enable. Core Clock: 96.00000 MHz Trace Enable

**TIP:** To find Core Clock frequency: Enter the global variable SystemCoreClock in a Watch window and run the program.

- 8. Unselect EXCTRC to minimize potential SWO overflows. This might not be needed. You can experiment later .
- 9. Click OK twice to close the Target configuration windows.

#### Add Two Global Variables to display in Logic Analyzer and Watch windows:

- 1. In Bubble.c, there are two interesting variables xAngle and yAngle that we want to display. These are local variables and hence cannot be displayed in the Logic Analyzer or Watch windows.
- 2. Declare two global variables near line 66 and 67. unsigned int XANGLE=0; and unsigned int YANGLE=0;
- 3. At the bottom of bubble.c near line 66 add these two assignment lines: 309 310 XANGLE = xAngle; 310 310 XANGLE = yAngle;
- 4. Click on File/Save All or
- 5. Build the files. There will be no errors or warnings.
- 6. Enter Debug mode:
- 7. In the main µVision Debug menu, select View and enable Periodic Window Update.
- 8. Click on RUN. 🕮 The program will be running with the red and blue LEDs changing when the board is moved.

### Add the XANGLE and YANGLE global variables to LA and Watch 1:

- 9. Right click on **XANGLE** and select Add XANGLE to... and select Logic Analyzer. Repeat for Watch 1.
- 10. Right click on **YANGLE** and select Add YANGLE to... and select Logic Analyzer. Repeat for Watch 1.

**TIP:** If an error results when adding counter to the LA, the most probable cause is SWV is not configured correctly.

- 11. In the LA, click on Setup and set Max: in Display Range to 90 or 0x5A for both variables. Click on Close.
- 12. In Zoom, set scaling for about 0.5 seconds.
- 13. The variables change as the board is rotated:

Name	Value	Туре
SystemCoreCloc	k 9600000	unsigned int
🔗 XANGLE	0x000001E	unsigned int
🗝 🔗 YANGLE	0x000002F	unsigned int
<enter expression=""></enter>	•	

Periodic Window Update

### 1) Serial Wire Viewer and ETM Instruction Trace Summary:

#### Serial Wire Viewer can see:

- Global variables.
- Static variables.
- Structures.
- Peripheral registers and physical memory just read or write to them.
- Can't see local variables. (just make them global or static).
- Can't see DMA transfers DMA bypasses CPU and SWV by definition.

#### Serial Wire Viewer displays in various ways:

- PC Samples.
- Data reads and writes.
- Exception and interrupt events.
- CPU counters.
- Timestamps.
- ITM for printf.

#### ETM Trace is good for:

- Trace adds significant power to debugging efforts. Tells where the program has been.
- A recorded history of the program execution *in the order it happened* as opposed to the way the program was written.
- Trace can often find nasty problems very quickly. Weeks or months can be replaced by minutes.
- Especially where the bug occurs a long time before the consequences are seen.
- Or where the state of the system disappears with a change in scope(s).

#### These are the types of problems that can be found with a quality ETM trace:

- Pointer problems. Illegal instructions and data aborts (such as misaligned writes).
- Code overwrites writes to Flash, unexpected writes to peripheral registers (SFRs), a corrupted stack. *How did I get here ?*
- Out of bounds data. Uninitialized variables and arrays.
- Stack overflows. What causes the stack to grow bigger than it should ?
- Runaway programs: your program has gone off into the weeds and you need to know what instruction caused this. Is very tough to find these problems without a trace. ETM trace is best for this.
- Communication protocol and timing issues. System timing problems.
- ETM facilitates Code Coverage, Performance Analysis and program flow debugging and analysis.

For information on Instruction Trace (ETM) please visit <u>www.keil.com/nxp</u> for other labs discussing ETM.

44

#### 2) Document Resources:

#### **Books:**

- 1. **NEW!** Getting Started with MDK 5: Obtain this free book here: <u>www.keil.com/gsg/</u>
- 2. There is a good selection of books available on ARM: <u>www.arm.com/support/resources/arm-books/index.php</u>
- 3. µVision contains a window titled Books. Many documents including data sheets are located there.
- 4. A list of resources is located at: <u>www.arm.com/products/processors/cortex-m/index.php</u> Click on the Resources tab. Or select the Cortex-M processor you want in the Processor panel on the left.
- 5. Or search for the Cortex-M processor you want on www.arm.com.
- 6. The Definitive Guide to the ARM Cortex-M0/M0+ by Joseph Yiu. Search the web for retailers.
- 7. The Definitive Guide to the ARM Cortex-M3/M4 by Joseph Yiu. Search the web for retailers.
- 8. Embedded Systems: Introduction to Arm Cortex-M Microcontrollers (3 volumes) by Jonathan Valvano
- 9. MOOC: Massive Open Online Class: University of Texas: <u>http://users.ece.utexas.edu/~valvano/</u>

### 3) Keil Products and contact information: See www.keil.com/NXP

#### Keil Microcontroller Development Kit (MDK-ARM™) for Kinetis processors:

- MDK-Lite<sup>™</sup> (Evaluation version) 32K Code and Data Limit \$0
- New MDK-ARM-CM<sup>™</sup> For all Cortex-M series processors only unlimited code limit
- **New MDK-Plus**<sup>™</sup> MiddleWare Level 1. ARM7<sup>™</sup>, ARM9<sup>™</sup>, Cortex-M, SecureCore<sup>®</sup>.
- *New* MDK-Professional<sup>™</sup> MiddleWare Level 2. For details: <u>www.keil.com/mdk5/version520</u>.

Keil Middleware includes Network, USB, Graphics and File System. www.keil.com/mdk5/middleware/

#### USB-JTAG adapter (for Flash programming too)

- ULINK2 (ULINK2 and ME SWV only no ETM)
- ULINK-ME sold only with a board by Keil or OEM
- ULINKpro Cortex-Mx SWV & ETM trace

You can use the OS-JTAG on the Kinetis Tower board. For Serial Wire Viewer (SWV), a ULINK2, ULINK-ME or a J-Link is needed. For ETM support, a ULINK*pro* is needed. OS-JTAG does not support either SWV or ETM debug technology.

Call Keil Sales for more details on current pricing. All products are available.

For the ARM University program: go to <u>www.arm.com/university</u> Email: university@arm.com

All software products include Technical Support and Updates for 1 year. This can be renewed.

#### Keil RTX<sup>™</sup> Real Time Operating System

- RTX is provided free as part of Keil MDK. It is the full version of RTX it is not restricted or crippled.
- No royalties are required and is very easy to use. It has a BSD license.
- RTX source code is included with all versions of MDK.
- Kernel Awareness visibility integral to µVision.

For the entire Keil catalog see <u>www.keil.com</u> or contact Keil or your local distributor.

For Linux, Android, bare metal (no OS) and other OS support on NXP i.MX and Vybrid series processors please see DS-5 at www.arm.com/ds5/ and www.keil.com/ds-mdk.
